

Contract number: ITEA2 – 10039

## Safe Automotive software architEcture (SAFE)

### ITEA Roadmap application domains:

Major: Services, Systems & Software Creation

Minor: Society

### ITEA Roadmap technology categories:

Major: Systems Engineering & Software Engineering

Minor 1: Engineering Process Support

### WP3 Deliverable D3.5.d:

### Final release of System, SW, HW reference meta-model definition

**Due date of deliverable:** 30/11/13

**Actual submission date:** 27/11/13

**Start date of the project:** 01/07/2011

Duration: 42 months

**Project coordinator name:** Stefan Voget

Organization name of lead contractor for this deliverable: ITEMIS

**Contributors:** Aquintos, BMW, Conti-F, Conti-G, Dassault Systèmes, fortiss, FZI, Itemis, LaBRI, OFFIS, PS, TTTech, VEEM.

## Revision chart and history log

Version	Date	Reason
0.1	2013-05-21	Initialization of document
0.2	2013-05-23	Conti-F review, change in section 2 and 5
1.0	2014-02-28	Conti-G, Finalization
2.0	2014-11-27	Conti-G, Update

## 2 Introduction

---

This document describes the language specification of SAFE.

The meta-model is based on the integration of the results of the conceptual work of all work tasks 3.x. It defines a domain specific language for safety modeling and safety analysis on M2 level. The meta-model provides extensions to EAST-ADL and AUTOSAR which are linked via references.

This document describes the meta-modeling rules, technical principles and the language specification based on an Enterprise Architect file.

Compared to D3.5.c this document is an update due to changes in the meta-model which are improvements found during the evaluation.

---

### The meta-model

---

The language specification is the core of the methods of the SAFE project. Its main objective is to enhance existing techniques to be able to reach the ISO26262 process in the context of model based development of E/E-architectures in vehicles or sub-systems of vehicles.

The target is to use model based techniques to represent the required entities capable to support safety case evaluation and documentation of vehicle architectures (and/or the subsystems). Results of safety assessments are recorded and documented including hazard identification and scenario goal description, in relation to safety requirements, their decomposition in the functional and technical architecture.

It delivers an open automotive meta-model for description of all design artefacts supporting the engineering process. It is based on the experience from the automotive domain and other domains and on existing techniques such as EAST-ADL for functional abstraction, AUTOSAR for software component, and a hardware description. The hardware part is improved to support electrical distribution systems and new hardware component descriptions either from the EAST-ADL hardware design extension and AUTOSAR ECU resource template with inspiration/alignment to the IP\_XACT standard. This meta-model covers specific modelling techniques to support analysis methods, to compare and manage architecture variants during the architecture design phase and as final product variant.

For the safety evaluation, the following objectives are considered:

- Failure error modelling and propagation to be able to perform safety and cut-set analysis thanks to model based technique, aligned with extending analysis methods such as FTA, FMEA with improved quantified value based on system execution context or new methods
- Hardware and software COTS evaluation methods for safety test conformity and integration in safety systems
- Clarification of needs via explicit elicitation of safety requirements and especially the decision tracing the safety measures
- Specification of criteria and methods for architecture safety evaluation and comparison to support design decisions regarding functional safety
- Generation of safety case documentation with respect to safety activities and related model based work-product

### **3 Modeling Rules**

This chapter collects some basic principles used in the definition of the SAFE meta-model.

To define a homogeneous meta-model and enable automatic code generation, a set of rules have been defined.

#### *Use of Enterprise Architect*

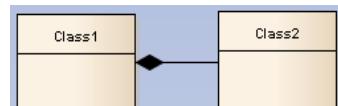

- **Rule 0:** Work on a replica
  - Rationale: Enables the merge function in EA, required to export a unique MM
- **Rule 1:** Provide documentation on
  - Diagrams
  - Packages
  - Classes
  - Attributes
  - Associations.
  - Rationale: Export from EA to deliverables.
    - It helps partners to understand your intentions
    - It can be used as javadoc in generated code
    - It can be included in generated documentation

#### *Class relations*

- **Rule 2:** Only 3 class relation types are allowed:

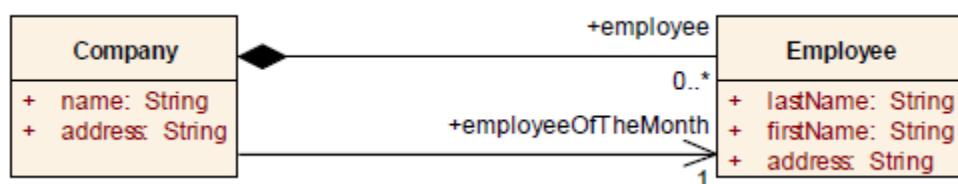

– Generalization

– Composition (i.e. contain)

– Direct Association

- **Rule 2.1:** For Compose and Association relations, multiplicity shall be explicitly defined
  - Rationale: otherwise the generator takes assumptions.
- **Rule 2.2:** For Compose and Association have to be named at the navigable end, not the connector itself.

- Rationale: otherwise relation have no mean for code generation
- **Rule 2.3:** Don't use Compose or Association relation with data-type or enumeration
  - Rationale: data-type and enumeration aren't class. (i.e. issue in code generation)
- **Rule 2.4:** always start creating the composition relation from the class to be aggregated
  - Rationale: Ecore generation process assumes that the source always aggregates the target.
- **Rule 2.5:** All associations starting at one class have to have different names at the navigable end.
  - Rationale: in Ecore the „features“ have to be unique

---

### Naming convention

---

- **Rule 3:** Only use java compliant names.
  - Rationale: Names used in the model will be used in generated code
  - Java compliant names (see <http://java.sun.com/>)
  - E.g.: no reserved keyword
  - Advice 1: Similar concept, different meta-model
    - Rationale: simplify understanding
    - Similar name. Ex: ARPPackage <-> SAFEPackage
- **Rule 3.1:** Spaces in entries of enumerations are not allowed

---

### Basic Data types

---

- **Rule 4:** Only use basic datatypes from the CommonStructure package
  - Rationale: what if a float is not a float?
- **Rule 4.1 :** These types have the stereotype <<primitive>> or <<enumeration>>
- **Rule 4.2:** All attributes shall have a type
- **Rule 4.3:** Default value shall have the same type

---

### Main structural principle of meta-model

---

SAFE uses SAFEElement as a root of the meta-model

- **Rule 5.1:** All classes inherit directly or indirectly from SAFEElement

SAFE uses SafetyExtension for structuring the meta-model along abstraction levels (the abstraction levels are taken from EAST-ADL and AUTOSAR).

- **Rule 5.2:** All classes are directly or indirectly contained in one of the subclasses of SafetyExtension

---

## References

---

Elements from foreign meta-models (e.g. Chromosome, EAST-ADL, AUTOSAR ...) can be referenced by using proxy elements. These elements are located in the package CommonStructure / References

- **Rule 6.1:** reference elements are used by containment relationship only
    - Rationale: if one links them via an association, the referenced element can not be created in a tool.
  - **Rule 6.2:** the reference element has the same name as the name in the original meta-model.
  - **Rule 6.3:** The meta-model is chosen by the package in which the element is located in
- 

## Abstract Classes

---

- Rule 7: Abstract classes are indicated to be abstract by setting the flag “Abstract” in the properties of the element. The flag is at the tab “Details”.

Note: sometimes the stereotype <>abstract<> is used to make the status more visible. But this setting is for diagram illustration only and does not have a meta-model meaning. Especially, the tool platform generator uses the flag above.

## **4 Information Model Structure**

The SAFE meta-model is structured in the following packages.

CommonStructure	<p>Technical package defining basic structures</p> <ul style="list-style-type: none"> <li>• AUTOSARInstanceRefs           <ul style="list-style-type: none"> <li>◦ Specific structure for instance refs to enable a referencing of AUTOSAR InstanceRefs from the SAFE meta-model.</li> </ul> </li> <li>• DataTypes           <ul style="list-style-type: none"> <li>◦ Collects all used primitive data types</li> </ul> </li> <li>• FormulaExpression           <ul style="list-style-type: none"> <li>◦ Enables the definition of formula language</li> </ul> </li> <li>• References           <ul style="list-style-type: none"> <li>◦ Enables the link and usage of external meta-models (e.g. EAST-ADL, AUTOSAR, CHROMOSOME, ...)</li> </ul> </li> <li>• SafetyExtensions           <ul style="list-style-type: none"> <li>◦ Basic structuring principle based on abstraction levels of SAFE meta-model</li> </ul> </li> <li>• TopLevel           <ul style="list-style-type: none"> <li>◦ 2<sup>nd</sup> structuring principle used in SAFE meta-model, based on hierarchies</li> </ul> </li> </ul>
Configuration	Link to variant management
ErrorModel	Basic component failure description as well as result of safety analysis
Hardware	Safety extensions on hardware level.
Hazards	Definition of hazard, risk, event, controllability
Requirements	Provides links to a requirements perspective and extends safety elements enabling the requirements traceability necessary to fulfill a safety process.
SafetyAnalysis	Safety analysis helping to classify malfunctions
Software	Safety extensions on software level
System	Safety extensions on system level

## 5. Model Documentation

### Model Detail

This document provides a complete overview of all element details. For simpler and more focused reports, simply copy this initial template and turn off the sections not required.

## ***Class FormulaExpression***

*Element Base Classes:* Identifiable

*Element Notes:*

This class represents the syntax of the formula language. The class is modeled as an abstract class in order to be specialized into particular use cases. For each use case the referable objects might be specified in the specialization.

The stereotype "mixedString" of this class and the specialized sub-classes indicates the usage of mixed content model with intermixed text. The grammar of the mixed content model is described in the description field of the dedicated class.

The term "mixed content" is used as defined in XML ([http://www.w3schools.com/schema/schema\\_complex\\_mixed.asp](http://www.w3schools.com/schema/schema_complex_mixed.asp)).

<b><u>Aggregation</u></b> Source -> Destination	SafetyCase	MultiLevelSafetyExtension
<b><u>Generalization</u></b> Source -> Destination	MultiLevelSafetyExtension	SafetyExtension

**Abstract SafetyExtension***Element Base Classes:* **SAFEElement***Element Notes:*

The abstract parent class of the different abstraction-level specific safety extensions.

Depending on the specific level of abstraction (HazardRiskModel, FunctionalSafetyExtension, TechnicalSafetyExtension, ...), the following restriction apply:

- the subtypes of AbstractSafetyRequirement (TechnicalSafetyRequirement, FunctionalSafetyRequirement, SafetyGoal, HW/SWSafetyRequirement) shall be used in the respective level of abstraction via the "requirements" relation of the safety extension
- the error model associated with the safety extension via the "erroModel" relation shall only allow to reference system model artifacts which are visibly at the level of abstraction of the safety extension (e.g. an AUTOSAR software component is not visible in the HazardandRiskModel)

**Attributes**

Attribute	Notes	Default
<b>category</b> Identifier	This element assigns a category to the parent element. The category is intended to specialize the usage and/or the content identifiable object. Such a specialization may also impose particular semantic constraints on the entire substructure (not only the identifiable itself).	
<b>uuid</b> String	<p>The purpose of this attribute is to provide a globally unique identifier for an instance of a metaclass. The values of this attribute should be globally unique strings prefixed by the type of identifier. For example, to include a DCE UUID as defined by The Open Group, the UUID would be preceded by "DCE:". The values of this attribute may be used to support merging of different AUTOSAR models.</p> <p>The form of the UUID (Universally Unique Identifier) is taken from a standard defined by the Open Group (was Open Software Foundation). This standard is widely used, including by Microsoft for COM (GUIDs) and by many companies for DCE, which is based on CORBA. The method for generating these 128-bit IDs is published in the standard and the effectiveness and uniqueness of the IDs is not in practice disputed.</p> <p>If the id namespace is omitted, DCE is assumed.</p> <p>An example is "DCE:2fac1234-31f8-11b4-a222-08002b34c003".</p>	

## Package Configuration

***Package Notes:***

Figure 15: Configuration - (Class diagram)

<u>Aggregation</u> Source -> Destination	MalfunctionType	ErrorModel

## Package ErrorBehavior

Package Notes:

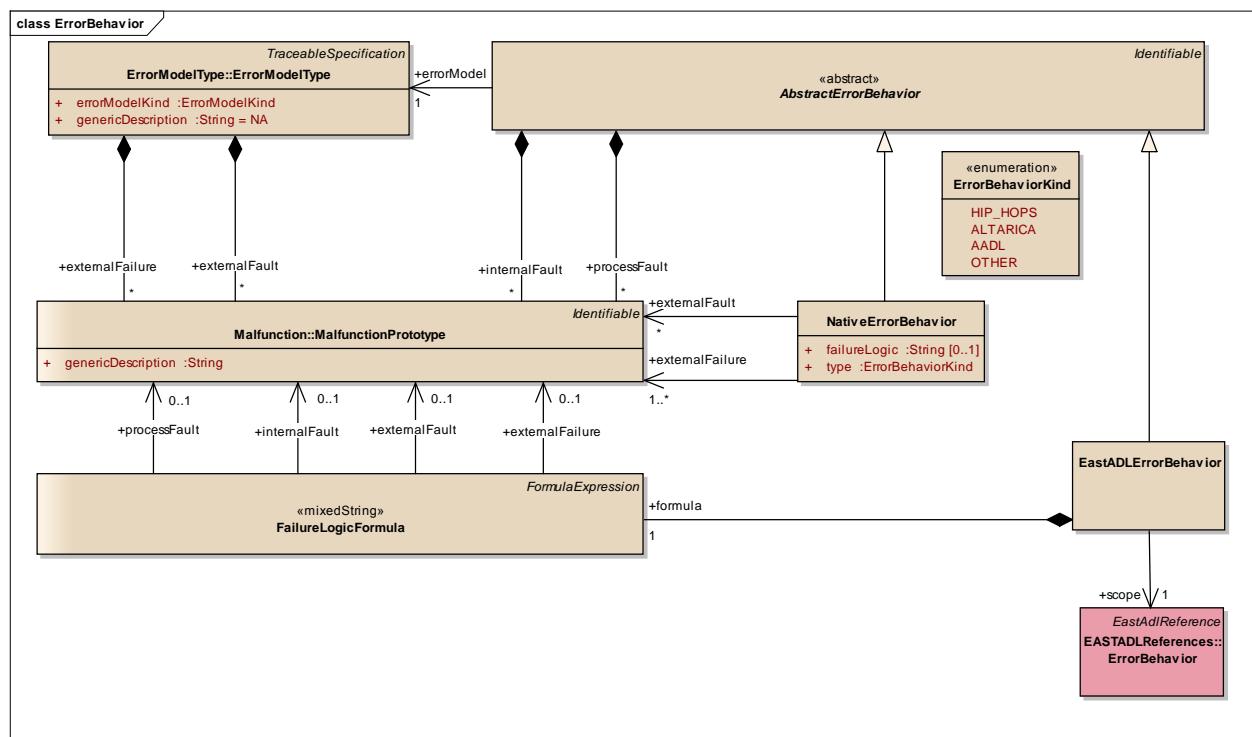

Figure 17: ErrorBehavior - (Class diagram)

Diagram Notes:

Diagram for ErrorBehavior.

### ***Abstract AbstractErrorBehavior***

*Element Base Classes:* **Identifiable**

*Element Notes:*

This class contains information about the error behavior independent of concrete behavior descriptions.

The AbstractErrorBehavior contains internalFaults, representing faults that are either propagated to externalFailures of the ErrorModelType or masked, according to the definition of its fault propagation.

A processFault represents a flaw introduced during design, and may lead to any of the failures represented by the ErrorModelType. A processFault therefore has a direct propagation to all externalFailures and cannot be masked.

Each error behavior description relates the occurrences of internal faults and incoming external faults to external failures. The faults and failures that the error behavior propagates to and from the target element are declared through the malfunction prototypes of the error model.

Semantics:

An error behavior describes the error propagation logic of its containing ErrorModelType.

The ErrorBehavior description represents the error propagation from internal faults or external faults to external failures. Faults are identified by the internalFault externalFault associations. The propagated external failures are identified by the externalFailure association.

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	EastADLErrorBehavior	AbstractErrorBehavior
<b><u>Aggregation</u></b> Source -> Destination	MalfunctionPrototype	AbstractErrorBehavior
<b><u>Generalization</u></b> Source -> Destination	NativeErrorBehavior	AbstractErrorBehavior
<b><u>Association</u></b> Source -> Destination	ErrorBehaviorMapping	AbstractErrorBehavior
<b><u>Association</u></b> Source -> Destination	AbstractErrorBehavior	ErrorModelType

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	AbstractErrorBehavior	ErrorModel
<u>Aggregation</u> Source -> Destination	MalfunctionPrototype	AbstractErrorBehavior
<u>Generalization</u> Source -> Destination	AbstractErrorBehavior	Identifiable

### Class EastADLErrorBehavior

Element Base Classes: AbstractErrorBehavior

*Element Notes:*

EASTADLErrorBehavior specifies a concrete failure logic description language, which describes the error propagation through the architectural element referenced by the containing ErrorModelType (e.g. function, hw component, sw component).

The failure logic is defined via a formula language called FailureLogicFormula (see "formula" association )

### Connections

Connector	Source	Target
<u>Generalization</u> Source -> Destination	EastADLErrorBehavior	AbstractErrorBehavior
<u>Aggregation</u> Source -> Destination	FailureLogicFormula	EastADLErrorBehavior
<u>Association</u> Source -> Destination	EastADLErrorBehavior	ErrorBehavior

### Enumeration ErrorBehaviorKind

Element Base Classes:

*Element Notes:*

The ErrorBehaviorKind metaclass represents an enumeration of literals describing various types of formalisms used for specifying error behavior.

Semantics:

ErrorBehaviorKind represents different formalisms for ErrorBehavior. The semantics is defined at each enumeration literal.

Extension:

Enumeration, no extension.

#### **Attributes**

Attribute	Notes	Default
<b>HIP_HOPS</b>	A specification of error behavior according to the external formalism HiP-HOPS.	
<b>ALTARICA</b>	A specification of error behavior according to the external formalism ALTARICA.	
<b>AADL</b>	A specification of error behavior according to the external formalism AADL.	
<b>OTHER</b>	A specification of error behavior according to other user defined formalism.	

#### **Class FailureLogicFormula**

Element Base Classes: [FormulaExpression](#)

#### *Element Notes:*

FailureLogicFormula is used to describe the error propagation through the architectural element associated with the containing ErrorModelType. The grammar of the FailureLogicFormula is defined in the respective specification document.

The failure logic formula language supports at least

- AND operator
- OR operator
- NOT operator
- local symbol or variable

- Typed for Boolean expression
- Allows stratified negation (failure itself shall not be used in its negated form), e.g. failure1 = fault2 or fault3 and not(failure1) expression is forbidden
- Permits to n:k gates. The error occurs if k out of n input faults occur.

### Connections

Connector	Source	Target
<u>Association</u> Source -> Destination	FailureLogicFormula	MalfunctionPrototype

<u>Association</u> Source -> Destination	FailureLogicFormula	MalfunctionPrototype
<u>Generalization</u> Source -> Destination	FailureLogicFormula	FormulaExpression
<u>Association</u> Source -> Destination	FailureLogicFormula	MalfunctionPrototype
<u>Aggregation</u> Source -> Destination	FailureLogicFormula	EastADLErrorBehavior

### Class NativeErrorBehavior

Element Base Classes: [AbstractErrorBehavior](#)

#### *Element Notes:*

NativeErrorBehavior represents the descriptions of failure logics or semantics that the architectural element associated by the ErrorModelType exhibits.

#### Semantics:

The NativeErrorBehavior is defined in the failureLogic string, either directly or as a url referencing an external specification.

The failureLogic can be based on different formalisms, depending on the analysis techniques and tools available. This is indicated by its type:ErrorBehaviorKind attribute. The failureLogic attribute contains the actual failure propagation logic.

Extension:

UML:Behavior

#### ***Connections***

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	NativeErrorBehavior	AbstractErrorBehavior
<b><u>Association</u></b> Source -> Destination	NativeErrorBehavior	MalfunctionPrototype
<b><u>Association</u></b> Source -> Destination	NativeErrorBehavior	MalfunctionPrototype

#### ***Attributes***

Attribute	Notes	Default
<b>failureLogic</b> String	The specification of error behavior based on an external formalism or the path to the file containing the external specification.	
<b>type</b> ErrorBehaviorKind	The type of formalism applied for the error behavior description.	

## Package ErrorModelType

*Package Notes:*

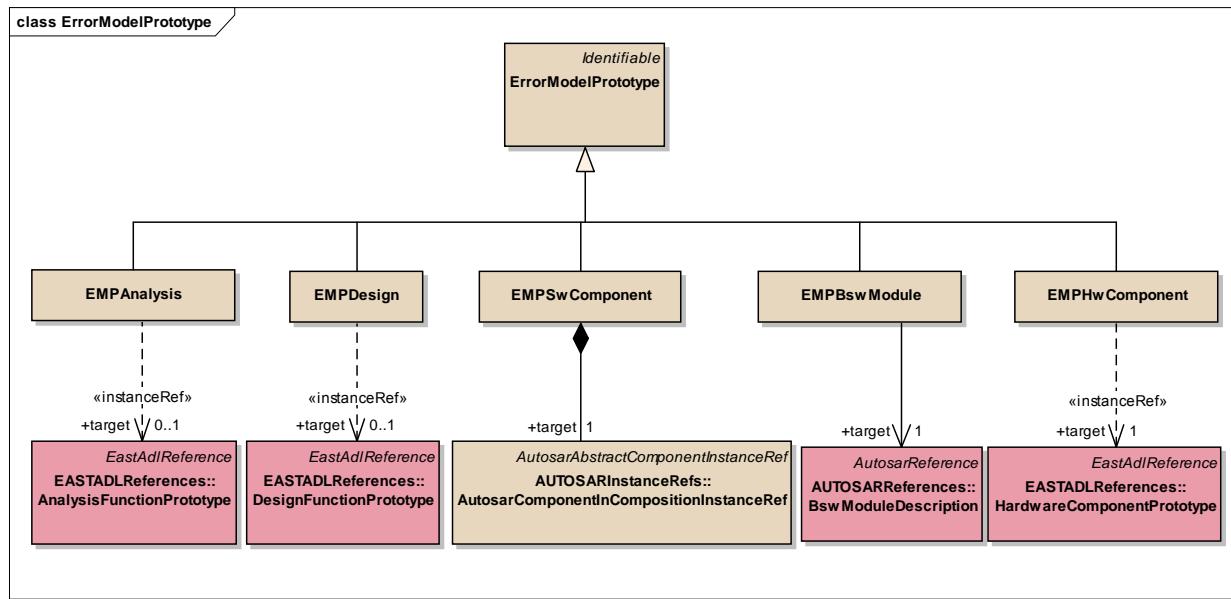

Figure 18: ErrorModelPrototype - (Class diagram)

<b><u>Association</u></b> Source -> Destination	EMTypeAnalysis	AnalysisFunctionType

**Class EMTypeApplicationEnvironment***Element Base Classes:* **ErrorModelType***Element Notes:*

The EMTYPEAPPLICATIONENVIRONMENT allows describing the error model for the runtime environment of application software on AUTOSAR implementation level. The application environment can be virtual, meaning that the modeled error model is an assumption of the environment the application software is running on. In a real system, EMTYPEAPPLICATIONENVIRONMENT is associated with a concrete ECUIINSTANCE in the system and (optional) with a ECU partition within this ECU. In this case, the error model represents the description of the unintended behavior originated by this runtime environment.

### Enumeration ErrorModelKind

Element Base Classes:

Element Notes:

#### Attributes

Attribute	Notes	Default
ASSUMPTION		
GUARANTEE		

### Class ErrorModelPrototype

Element Base Classes: Identifiable

Element Notes:

The ErrorModelPrototype is used to define hierarchical error models allowing additional detail or structure to the error model of a particular target. A hierachal structure can also be defined when several ErrorModels are integrated to a larger ErrorModel representing a system integrated from several targets.

There are diffent subtypes of ErrorModelPrototype specified, allowing to add additional information describe the context of the ErrorModelPrototype.

Semantics:

An ErrorModelPrototype represents an occurrence of the ErrorModelType that types it.

Extension:

(See ADLFunctionPrototype)

### ***Class ErrorModelType***

*Element Base Classes:* **TraceableSpecification**

*Element Notes:*

ErrorModelError and ErrorModelPrototype support the hierarchical composition of error models based on the type-prototype pattern also adopted for the nominal architecture composition. The purpose of the error models is to represent information relating to the anomalies of a nominal model element.

Independent of the different subtypes of ErrorModelError, this class describes the external faults affecting the element, external failures caused by the element and fault propagations within the nominal element.

ErrorModelError inherits the abstract metaclass TraceableSpecification, allowing the ErrorModelError to be referenced from its design context in a similar way as requirements, test cases and other specifications.

Constraints:

For An ErrorModelError without part, a respective error behavior shall be defined in the safety model.

Semantics:

The ErrorModelError represents a specification of the faults and fault propagations of its target element.

Both types and prototypes may be targets, and the following cases are relevant:

- One nominal type:

The ErrorModelError represents the identified nominal type wherever this nominal type is instantiated.

- Several nominal types:

The ErrorModelError represents the identified nominal types individually, i.e. the same error model applies to all nominal types and is reused.

- One nominal prototype:

The ErrorModelError represents the identified nominal prototype whenever its context, i.e. its top-level composition is instantiated.

- Several nominal prototypes with instanceref:

The ErrorModelError represents the identified set of nominal prototypes (together) whenever their context, i.e. their top-level composition, is instantiated.

The fault propagation of an errorModelType is defined by its contained parts, the ErrorModelPrototypes and their connections. In case an error behavior is defined for this error model type, the fault propagation information, the error behavior and the parts of the error model shall be consistent.

FaultFailurePropagationLinks define valid propagation paths in the ErrorModelType. In case the contained external faults and external failures reference nominal ports, the connectivity of the nominal model may serve as a pattern for connecting malfunction prototypes in the ErrorModelType.

Extension:

(see ADLTraceableSpecification)

***Class FaultFailurePropagationLink***Element Base Classes: Identifiable**Element Notes:**

The FaultFailurePropagationLink metaclass represents the links for the propagations of faults/failures across system elements. In particular, it defines that one error model provides the faults/failures that another error model receives.

A fault/failure link can only be applied to compatible ports, either for fault/failure delegation within an error model or for fault/failure transmission across two error models. A FaultFailurePropagationLink can only connect fault/failures that have compatible types.

**Constraints:**

[1] Only compatible cause-effect pairs may be connected.

[2] Two fault/failure are compatible if the MalfunctionType of the cause represents a subset of the MalfunctionType set represented by the MalfunctionType of the effect.

Semantics:

The FaultFailurePropagationLink defines a Failure propagation path, from the cause on one error model to the effect of another error model.

Extension:

UML::Connector

**Class MTComposite**Element Base Classes: **MalfunctionType***Element Notes:*

This composite malfunction type allows to define the different ways, how the malfunction becomes visible. As a typical example, a composite malfunction type could have the elements "commission" and "omission".

BrakeMalfunctionType (type: MTComposite):

- BrakePressureTooLow (type: MTPrimitive):

Semantics="brake pressure is below 20% of requested value"

- Omission (type: MTPrimitive):

Semantics="brake pressure is below 10% of maximal brake pressure"

- Commission (type: MTPrimitive):

Semantics="brake pressure exceeds requested value with more than 10% of maximal brake pressure".

**Class MTPrimitive***Element Base Classes:* MalfunctionType*Element Notes:*

This class is used for the atomic definition of a malfunction type. The description field of the derived Identifiable class shall be used to describe the malfunction type.

**Connections**

Connector	Source	Target
<u>Generalization</u> Source -> Destination	MTPrimitive	MalfunctionType

**Class MalfunctionPrototype***Element Base Classes:* Identifiable*Element Notes:*

A malfunction is a failure or unintended behavior of the item or element of the item that has the potential to propagate. The MalfunctionPrototype metaclass represents an error that may occur internally in an ErrorModel or be propagated to it, or a failure that is propagated out of an Error Model. The MalfunctionPrototype may represent different errors depending on its type (enumeration of generic description).

**Semantics:**

An malfunction prototype refers to a condition that deviates from expectations based on requirements specifications, design documents, user documents, standards, etc., or from someone's perceptions or experiences (ISO26262). The set of available faults or failures represented by the MalfunctionPrototype is defined by its type, typically an enumeration type like {omission, commission}. It is an abstract class further specialized with metaclasses for different types of fault/failure.

### **Package Mapping**

*Package Notes:*

Figure 23: ErrorBehaviorMapping - (Class diagram)

*Diagram Notes:*

### Class ErrorBehaviorMapping

*Element Base Classes:* Identifiable

*Element Notes:*

The class `ErrorBehaviorMapping` allows to map an error behavior to a concrete instance of an `ErrorModelType` within the `ErrorModel`. For each instance reference referred by the association named "errorModel", the following rule must be considered:

- The `ErrorModelType` of the first context element in the `instanceRef` of type `ErrorModelInstanceRef` must match with the attribute "rootErrorModelType" of the `ErrorModel`, where this `ErrorBehaviorMapping` is contained

**Connections**

Connector	Source	Target

<b><u>Generalization</u></b> Source -> Destination	ErrorBehaviorMapping	Identifiable
<b><u>Aggregation</u></b> Source -> Destination	ErrorModelInstanceRef	ErrorBehaviorMapping

**Class ErrorModelMapping**Element Base Classes: **Identifiable*****Element Notes:***

This class contains mapping information for error model.

**Connections**

Connector	Source	Target
<b><u>Aggregation</u></b> Source -> Destination	ErrorBehaviorMapping	ErrorModelMapping
<b><u>Aggregation</u></b> Source -> Destination	ErrorModelMapping	ErrorModel
<b><u>Generalization</u></b> Source -> Destination	ErrorModelMapping	Identifiable
<b><u>Aggregation</u></b> Source -> Destination	MalfunctionMapping	ErrorModelMapping

**Class MalfunctionMapping**Element Base Classes: **Identifiable**

***Element Notes:***

Via the class MalfunctionMapping it is possible to map malfunctions of one abstraction level (e.g. EAST ADL implementation level) to another level of abstraction (e.g. EAST ADL analysis level). This way the correlation between different levels of abstraction can be made explicit.

The MalfunctionMapping shall be attached to the "lower" level of abstraction. Example:

- a malfunction defined for a software component (implementation level) shall be related with a malfunction defined on design level
- in this case, (at least) two instances of SafetyExtensions (TechnicalSafetyExtension, AutosarSystemSafetyExtension) exist. In each of them an ErrorModelType is defined containing the before mentioned malfunctions
- in the AutosarSystemSafetyExtension, we define an MalfunctionMapping and relate the software malfunction (in the role of "origin") to the malfunction defined within the TechnicalSafetyExtension (in the role "target")

Thus, the following rules shall be applied:

- the MalfunctionPrototype referenced via the "origin" relationship shall be defined within the same SafetyExtension as an instance of this class
- the MalfunctionPrototype references via the "target" relationship shall be defined within a SafetyExtension which corresponds to a higher level of abstraction

**Package Hardware***Package Notes:*

This package describes the top-level package for all meta model extension regarding hardware, developed in WT 3.2.2.

## Package Failure

### Package Notes:

This sub-package describes the failure model of the hardware as derived from the requirements of the ISO 26262.

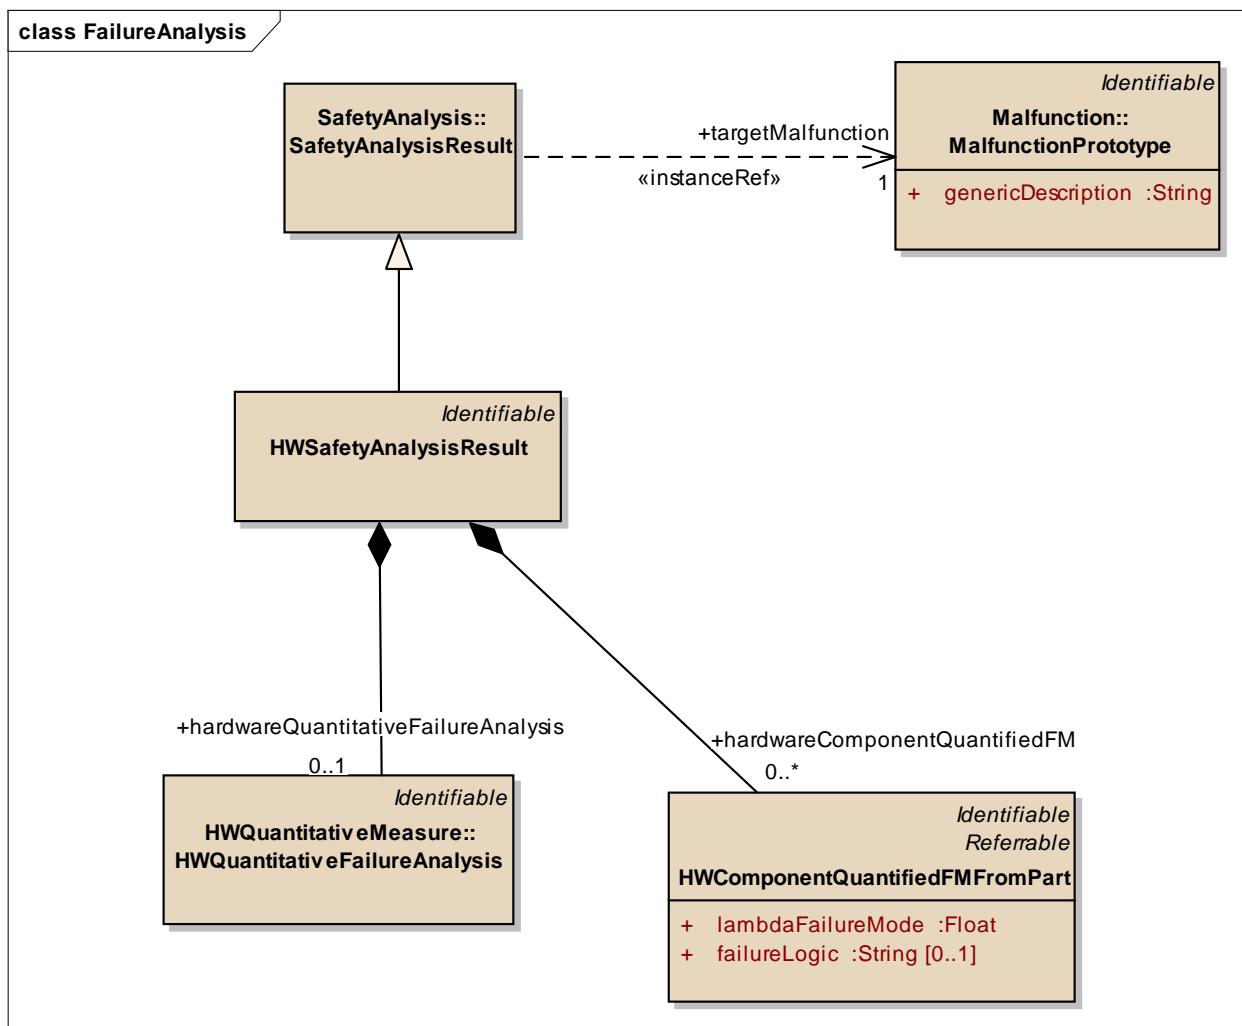

Figure 33: FailureAnalysis - (Class diagram)

### Diagram Notes:

This diagram shows an overview of the hardware component failure extension root information where hardware related failure data and analysis shall be performed.

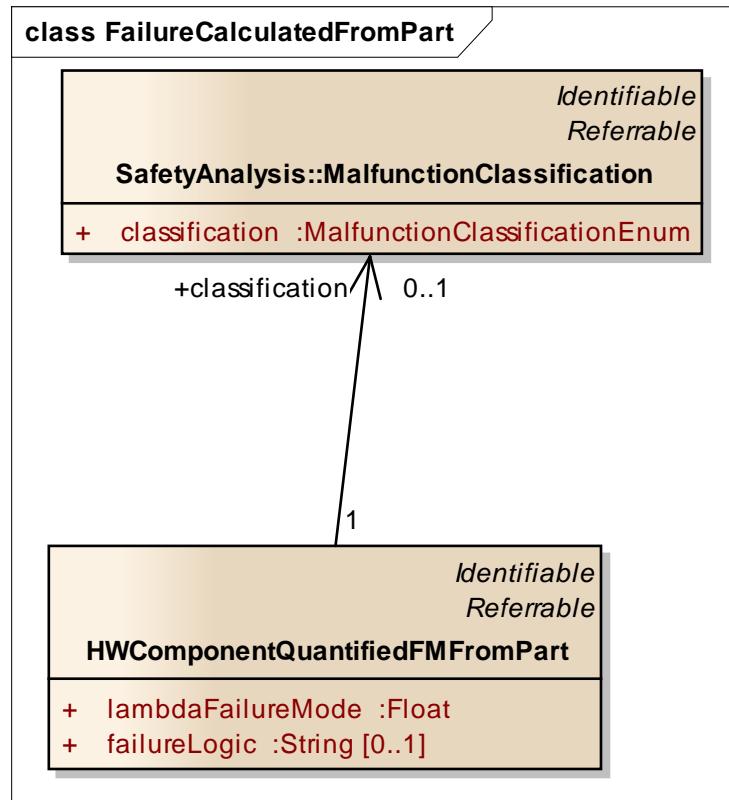

Figure 34: **FailureCalculatedFromPart** - (Class diagram)

#### Diagram Notes:

This diagram shows the instance reference of a failure mode of a hardware component on higher level and its interference with hardware element part calculations.

#### **Class HWComponentQuantifiedFMMFromPart**

*Element Base Classes:* **Identifiable, Referrable**

#### *Element Notes:*

This class describes the quantified failure rate of a failure mode of a HWComponent based on the contribution of each HWPartFailureMode of the related HWPart as AUTOSAR HW Element (calculated with the formula and stored in the attribute lambdaFailureMode).

The attribute SafetyComponentClassName is used to identify the HWComponent Class name for further calculation of all failure mode to the same HWComponent.

A quantified HW ComponentFailureMode must identify the related HWFailureMode of the HWComponent.

During modeling a design rule must be ensured that AutosarHWEElementType used as BaseHwElement for the instanceRef relation is the same as the root hierarchy on the HwElement creation

### Connections

Connector	Source	Target

<u>Association</u> Unspecified	HWPartFailureAnalysis	HWComponentQuantifiedFMFromPart
<u>Generalization</u> Source -> Destination	HWComponentQuantifiedFMFromPart	Referrable

### Attributes

Attribute	Notes	Default
<b>lambdaFailureMode</b> Float	This attribute contains the quantified failure rate for the corresponding failure mode of the hardware component.	
<b>failureLogic</b> String	Define the specification of HWPartFailureMode contribution to HWFailureMode of the above abstraction layer (Block)on an external formalism or the path to the file containing the external specification.	

### Class HWSafetyAnalysisResult

Element Base Classes: Identifiable, SafetyAnalysisResult

#### Element Notes:

This class represent the container for all Hardware Failure Analysis.

Each safety goal (as malfunction) must lead to a safety analysis, so this class contains all the information related to the analysis as :

- the relation to the malfunction as the malfunctionPrototype for each analysis
- the HwComponentPrototypeScope to identify all hardware component specific to the context as HWComponentPrototype inside a type composition
- the HWQuantifiedFailure Analysis performed on the level of the composition

#### Connections

## ***Class HWPartFailureAnalysis***

*Element Base Classes:* **Identifiable**

*Element Notes:*

This class represent the container for all Hardware Part Failure Analysis (Autosar HWElement) for a malfunction.

Each malfunction (as Hardware Failure Mode) must lead to a safety part analysis, so this class contains all the information related to the analysis as :

- the relation to the malfunction as the malfunctionPrototype for each analysis
- the HwElementPrototypeScope to identify all hardware Autosar Element specific to the context as HWComponentPrototype inside a type composition
- the HWComponentQuantifiedFMFromPart Analysis performed on the level of the composition of hardware part for contribution to the malfunction

## ***Connections***

### Class HWPartFailureMode

*Element Base Classes:*

*Element Notes:*

This class describes HWPartFailureModes of a HWPart as AUTOSAR HWElement. It also captures the potential cause for a HWFailureMode as String (for documentation).

Each HWPartFailureMode of the Autosar HardwareElement must define a relation and contribution to a HWFailureMode of HardwareComponent (from hardware design level).

The HWFailureMode and HWFailureRateDistribution can be derived from e.g. Industry Source.

### Connections

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	HWPartFailureMode	HWPartFailure

### Attributes

Attribute	Notes	Default
<b>partFailureModeType</b> String	This attribute textually describes the type of a failure mode of a HWPart element (e.g. "ShortCircuit" for a resistor).	
<b>FailureRateDistribution</b> Integer	This attribute describes the distribution of the failure rate of the HWPart element for the specific hardware part failure mode in percentage.	
<b>partPotentialCause</b> String	This attribute allows the documentation of the potential cause of the HWPart failure mode (e.g. high temperature).	

### Class HWPartFailureRate

*Element Base Classes:*

*Element Notes:*

This class captures the HWPartFailureRate of a AUTOSAR HWElement. Each AUTOSAR HWElement has one single Part HWFailureRate.

The appropriate Part FailureRate can be derived from e.g. Industry Source.

#### Connections

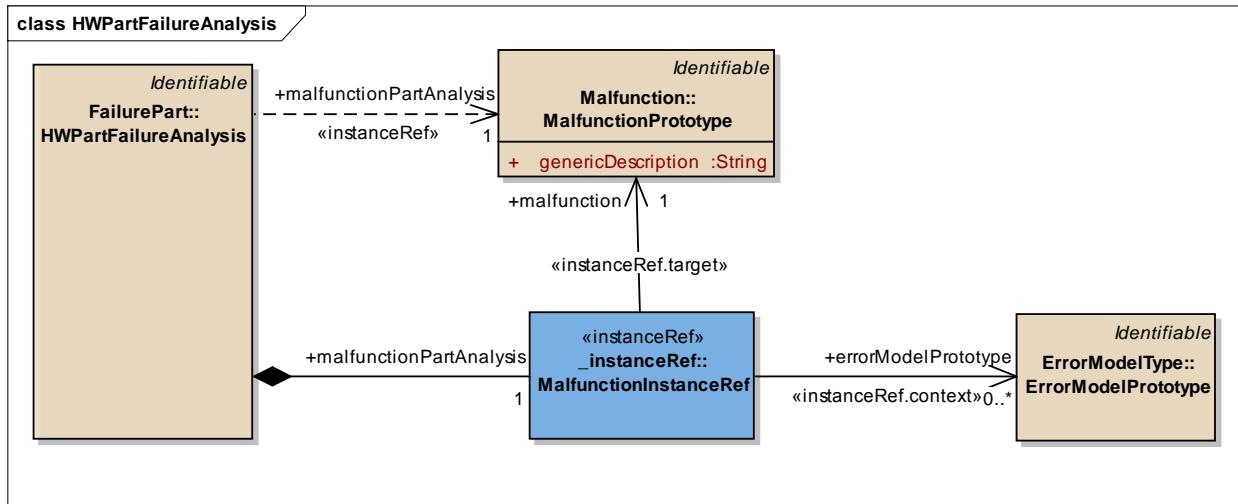

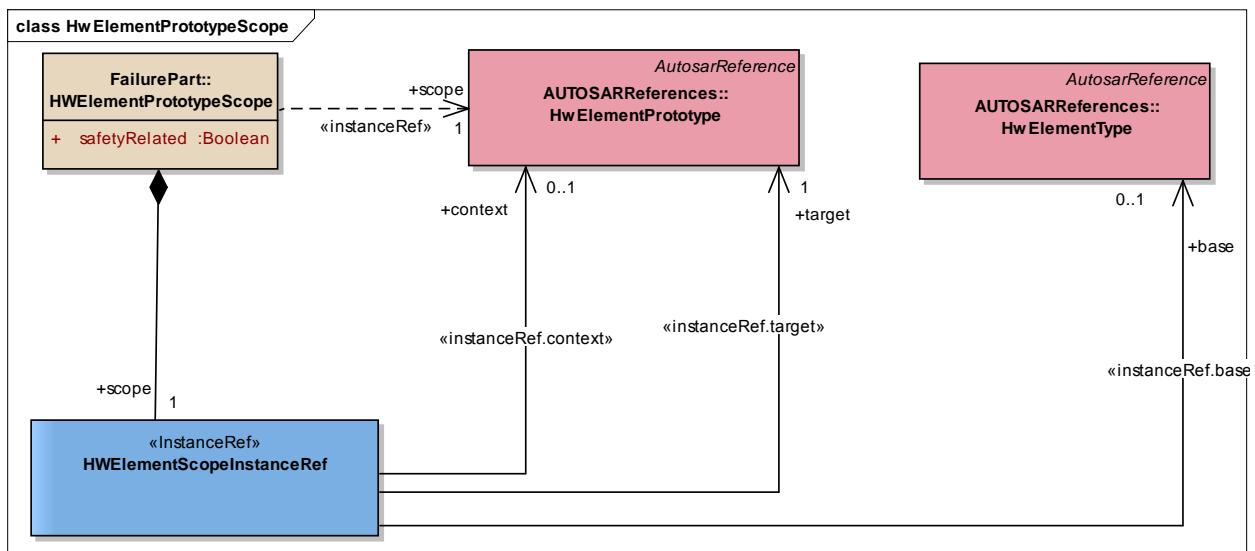

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	HWPartFailureRate	HWPartFailure

#### Attributes

Attribute	Notes	Default
<b>rationaleScalingFactor</b> String	The rationaleScalingFactor shall provide a rationale, if a scaling factor different to 1.0 is applied.	
<b>scalingFactor</b> Float	The scalingFactor allows potential scaling between different sources of failure rates as described in ISO Part 5 Annex F.	1.0
<b>source</b> String	FIT rate source shall documented according to possible source as described in ISO 26262 Part 5 8.4.3:  a) failure rate from industry source (IEC/TR 62380, IEC 61709, ...)  b) statistic based on return field or test  c) Expert judgement	
<b>value</b> Float	FIT rate for the hardware part element.  It shall be expressed in FIT.	

#### Package \_instanceRef

*Package Notes:*

Figure 38: **HWPartFailureAnalysis** - (Class diagram)*Diagram Notes:*Figure 39: **HwElementPrototypeScope** - (Class diagram)*Diagram Notes:*

This diagram shows the instance reference of a Hardware Component Quantified failure Value issued from Hardware Part.

### **Class HWELEMENTSCOPEINSTANCEREF**

*Element Base Classes:**Element Notes:*

This "instanceRef" meta-class is the container for holding the relation of HWELEMENTSCOPE in context of AUTOSARHWELEMENTPROTOTYPE

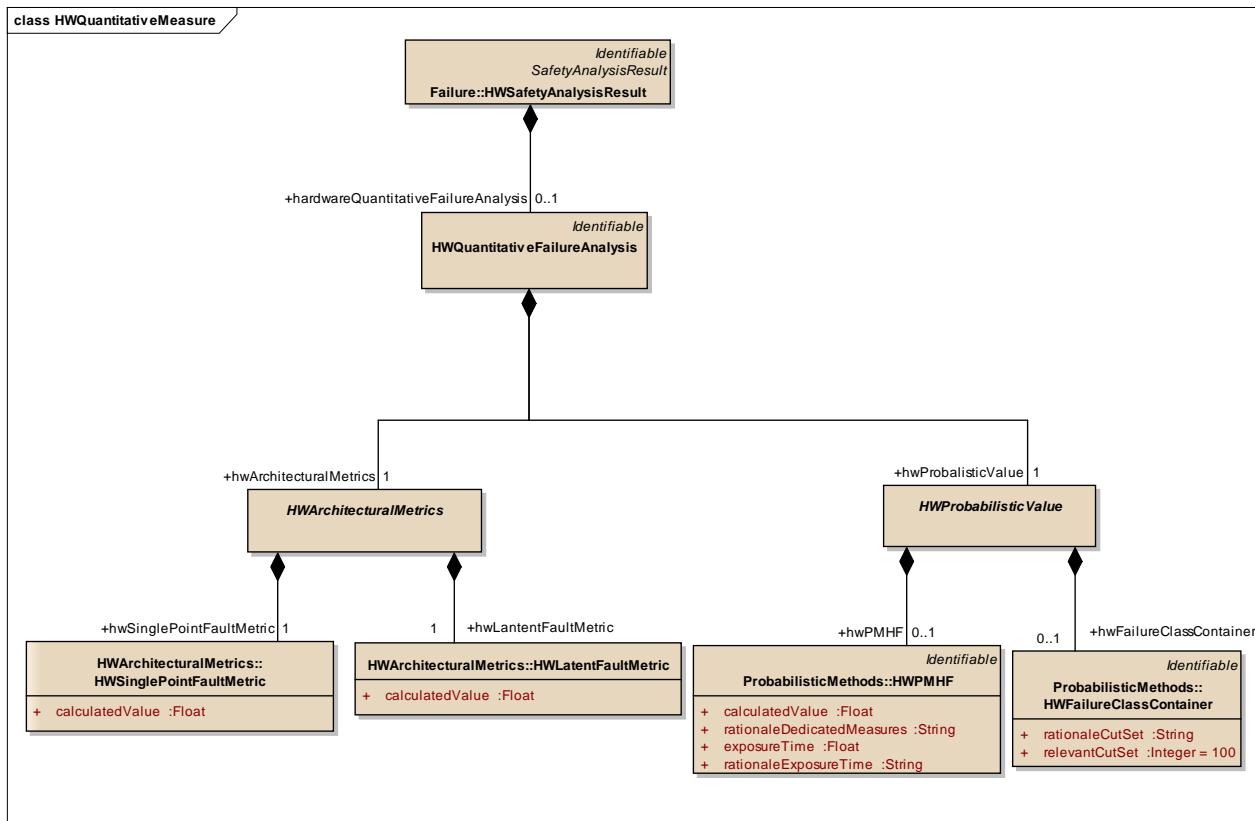

#### Connections

<u>Association</u> Unspecified	HWELEMENTPROTOTYPESCOPE	HWELEMENTSCOPEINSTANCEREF

## Package HWQuantitativeMeasure

### *Package Notes:*

This sub-package contains the storage and classification of the safety evaluation. In addition it includes the single failure mode contribution as basis for the concrete evaluation.

Figure 40: **HWQuantitativeMeasure** - (Class diagram)**Diagram Notes:**

This diagram gives an overview about the quantitative analysis claimed by ISO 26262 Part 5 Clause 8 and Clause 9.

**Class HWArchitecturalMetrics****Element Base Classes:****Element Notes:**

This class represents an abstract definition of all quantified failure analysis required by the ISO Part 5 Clause 8. This class allows to map all meta class for the HWArchitecturalMetrics also described in the ISO Part 5-Annex C (Single-Point-Fault Metric, Latent-Fault Metric).

Each HWQuantifiedFailureAnalysis belongs to exactly one malfunction (link to violation of a SafetyGoal). The ASIL-TargetValue (e.g. ASIL-D) is derived from the SafetyGoal.

**Connections**

### Class HWProbabilisticValue

Element Base Classes:

*Element Notes:*

This class represents an abstract definition of all failure analysis required by the ISO Part 5 Clause 9. This class allows to map all meta class for the evaluation of safety goal violation (PMHF and Failure Rate Class).

Each HWQuantifiedFailureAnalysis belongs to exactly one malfunction (link to violation of a SafetyGoal). The ASIL-TargetValue (e.g. ASIL-D) is derived from the SafetyGoal.

### Connections

### Class HWQuantitativeFailureAnalysis

Element Base Classes: Identifiable

*Element Notes:*

This class represent the container for all quantified failure analysis required by the ISO 26262 Part 5 for a dedicated SafetyGoal. This class allows to cluster all meta class for the HWArchitecturalMetrics

described in the ISO Part 5 Clause 8 (Single-Point-Fault Metric, Latent-Fault Metric) and probabilistic value for violation of safety goal (PMH) or Failure Class Method described in the ISO Part 5 Clause 9.

Each HWFailureAnalysis belongs to exactly one SafetyGoal. The ASIL-TargetValue (e.g. ASIL-D) is derived from the SafetyGoal.

## Package HWArchitecturalMetrics

### *Package Notes:*

This sub-package describes the hardware architectural metrics as claimed by ISO 26262 Part 5 Clause 8. A detailed description of the architectural metrics can be found in ISO 26262 Part 5 Annex C.

### Class HWLatentFaultMetric

#### *Element Base Classes:*

#### *Element Notes:*

This class is the representation of the latent fault metric, demanded by ISO Part 5 Clause 8. The latent fault metric describes the robustness of the hardware architecture to cope with multiple-point latent faults (also see ISO Part 5 Annex C).

The calculation is included in the class HWLatentFaultMetricFormula.

**Connections**

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	HWLatentFaultMetric	HWArchitecturalMetrics

**Attributes**

Attribute	Notes	Default
<b>calculatedValue</b> Float	The calculatedValue is the result of the calculation of the latent fault metric (in %).	

**Class HWSinglePointFaultMetric**

*Element Base Classes:*

*Element Notes:*

This class is the representation of the single-point fault metric, demanded by ISO Part 5 Clause 8. The single-point fault metric describes the robustness of the hardware architecture to cope with single-point and residual faults (also see ISO Part 5 Annex C).

The calculation is included in the class HWSinglePointFaultMetricFormula.

**Connections**

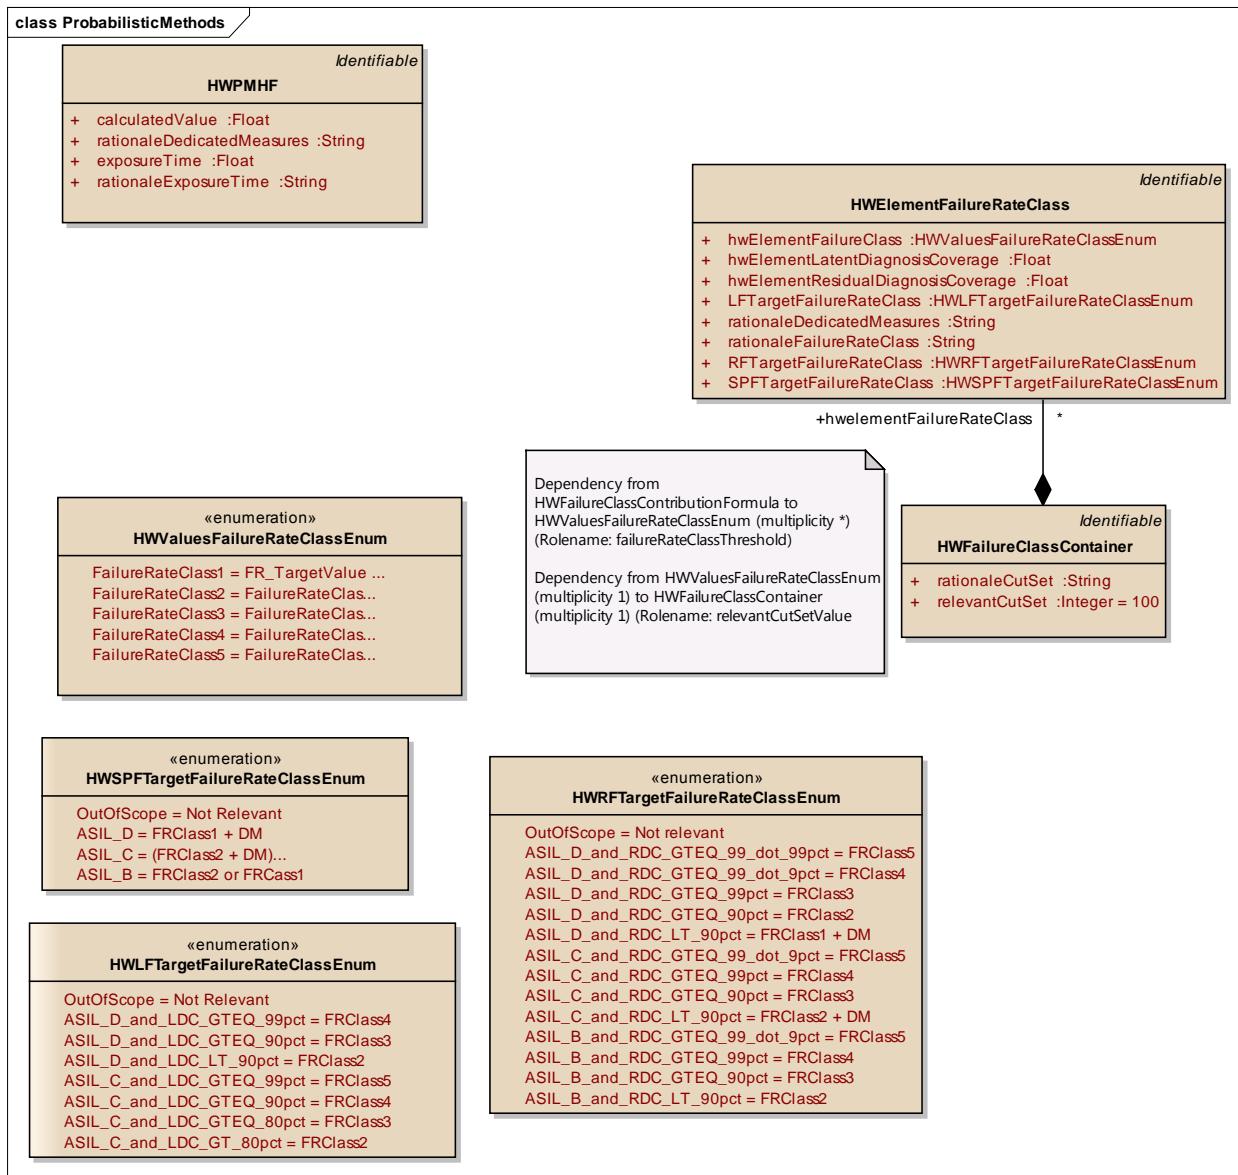

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	HWSinglePointFaultMetric	HWArchitecturalMetrics

**Attributes**

Attribute	Notes	Default
<b>calculatedValue</b> Float	The calculatedValue is the result of the calculation of the single-point fault metric (in %).	

**Package ProbabilisticMethods***Package Notes:*

This sub-package describes the residual risk of safety goal violation due to random hardware failures as claimed by ISO 26262 Part 5 Clause 9. This contains the probabilistic metric for random hardware failures (PMHF) and as an alternative the failure rate class method (FRC).

Figure 41: **ProbabilisticMethods** - (Class diagram)**Diagram Notes:**

This diagram contains the evaluation of safety goal violation according to ISO 26262 Part 5 Clause 9. This contains the PMHF and the FRC.

**Class HWEElementFailureRateClass**

**Element Base Classes:** Identifiable

**Element Notes:**

This class describes for a HWComponent, the FailureRateClass element to evaluate measure for a malfunction (link to violation of a safety goal) for a single element. This violation is based on failure rate class according to context of evaluation such as ASIL level, list of HWFault and diagnosis coverage of the HWComponent as HW Element. It allows also storing the target for failure rate class, relevant or not depending of the possible HWFault of the failure mode of the HWComponent as hardware Element. Furthermore if dedicated measures (DM) are required due to failure class target matching and the necessary information are captured as a textual description.

The calculation of the attribute HWElementFailureClass and HWElementDiagnosisCoverage is derived from the Formula Expression FMSingleContributionFormula.

#### Connections

<b>ASIL_D_and_LDC_LT_90pct</b> String	This literal describes a single cell with value target failure rate class 2 in the table for ASIL-D and latent diagnostic coverage $< 90\%$ .	FRClass2

Attribute	Notes	Default
<b>ASIL_C_and_LDC_GTE_Q_99pct</b> String	This literal describes a single cell with value target failure rate class 5 in the table for ASIL-C and latent diagnostic coverage $\geq 99\%$ .	FRClass5
<b>ASIL_C_and_LDC_GTE_Q_90pct</b> String	This literal describes a single cell with value target failure rate class 4 in the table for ASIL-C and latent diagnostic coverage $\geq 90\%$ .	FRClass4
<b>ASIL_C_and_LDC_GTE_Q_80pct</b> String	This literal describes a single cell with value target failure rate class 3 in the table for ASIL-C and latent diagnostic coverage $\geq 80\%$ .  Rationale provided by ISO 26262 Part 5 9.4.3.9.	FRClass3
<b>ASIL_C_and_LDC_GT_80pct</b> String	This literal describes a single cell with value target failure rate class 2 in the table for ASIL-C and latent diagnostic coverage $< 80\%$ .  Rationale provided by ISO 26262 Part 5 9.4.3.9.	FRClass2

### Class HWPMHF

Element Base Classes: Identifiable

*Element Notes:*

This class describes the Probabilistic Metric for random Hardware Failures (PMHF) as in ISO Part 5 Clause 9.4.2.

A simplified alculation is included in the class HWPMHFFormula.

### Connections

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	HWPMHF	HWProbabilisticValue
<u>Generalization</u> Source -> Destination	HWPMHF	Identifiable

### Attributes

Attribute	Notes	Default

Attribute	Notes	Default
<b>calculatedValue</b> Float	The calculatedValue is the result of the calculation of the PMHF (in FIT).	
<b>rationaleDedicatedMeasures</b> String	The attribute rationaleDedicatedMeasures shall allow to define a rationale for applied dedicated measures in the design.	
<b>exposureTime</b> Float	The exposure time is the duration of exposure, shall be expressed in h.	
<b>rationaleExposureTime</b> String	The attribute rationaleExposureTime is for Documentation of rationale for Exposure Time.	

### Enumeration HWRFTargetFailureRateClassEnum

*Element Base Classes:*

*Element Notes:*

ISO 26262 Part 5 9.4.3.6 -Table 8 (Maximum failure rate classes for a given diagnostic coverage of the hardware part - residual faults).

DM: Dedicated measures

RDC: Diagnostic coverage with respect to residual faults

This class describes the threshold for Residual Failure according to ASIL level and identifying Failure Class Rate limit (FRClassx) and Dedicated Measure (DM) if necessary. Notice that RDC is addressing the hwElementResidualDiagnosisCoverage parameter of the HWElementFailureRateClass

Additionally, "OUT-OF-SCOPE" and "ASIL-D and RDC >=99.99%" according to ISO 26262 Part 5 9.4.3.7.

### Attributes

Attribute	Notes	Default
<b>OutOfScope</b> String	This literal describes values which are out of scope for the analysis.	Not relevant
<b>ASIL_D_and_RDC_GTE_Q_99_dot_99pct</b>	This literal describes a single cell with value target failure rate class 5 in the table for ASIL-D and residual fault diagnostic coverage >= 99.99%.	FRClass5

Attribute	Notes	Default
String	Failure Rate Class determined according to ISO 26262 Part 5 9.4.3.7.	
<b>ASIL_D_and_RDC_GTE_Q_99_dot_9pct</b> String	This literal describes a single cell with value target failure rate class 4 in the table for ASIL-D and residual fault diagnostic coverage >= 99.9%.	FRClass4
<b>ASIL_D_and_RDC_GTE_Q_99pct</b> String	This literal describes a single cell with value target failure rate class 3 in the table for ASIL-D and residual fault diagnostic coverage >= 99%.	FRClass3
<b>ASIL_D_and_RDC_GTE_Q_90pct</b> String	This literal describes a single cell with value target failure rate class 2 in the table for ASIL-D and residual fault diagnostic coverage >= 90%.	FRClass2
<b>ASIL_D_and_RDC_LT_90pct</b> String	This literal describes a single cell with value target failure rate class 1 + dedicated measures in the table for ASIL-D and residual fault diagnostic coverage < 90%.	FRClass1 + DM
<b>ASIL_C_and_RDC_GTE_Q_99_dot_9pct</b> String	This literal describes a single cell with value target failure rate class 5 in the table for ASIL-C and residual fault diagnostic coverage >= 99.9%.	FRClass5
<b>ASIL_C_and_RDC_GTE_Q_99pct</b> String	This literal describes a single cell with value target failure rate class 4 in the table for ASIL-C and residual fault diagnostic coverage >= 99%.	FRClass4
<b>ASIL_C_and_RDC_GTE_Q_90pct</b> String	This literal describes a single cell with value target failure rate class 3 in the table for ASIL-C and residual fault diagnostic coverage >= 90%.	FRClass3
<b>ASIL_C_and_RDC_LT_90pct</b> String	This literal describes a single cell with value target failure rate class 2 + dedicated measures in the table for ASIL-C and residual fault diagnostic coverage < 90%.	FRClass2 + DM
<b>ASIL_B_and_RDC_GTE_Q_99_dot_9pct</b> String	This literal describes a single cell with value target failure rate class 5 in the table for ASIL-B and residual fault diagnostic coverage >= 99.9%.	FRClass5
<b>ASIL_B_and_RDC_GTE_Q_99pct</b> String	This literal describes a single cell with value target failure rate class 4 in the table for ASIL-B and residual fault diagnostic coverage >= 99%.	FRClass4
<b>ASIL_B_and_RDC_GTE_Q_90pct</b> String	This literal describes a single cell with value target failure rate class 3 in the table for ASIL-B and residual fault diagnostic coverage >= 90%.	FRClass3

Attribute	Notes	Default
<b>ASIL_B_and_RDC_LT_90pct</b> String	This literal describes a single cell with value target failure rate class 2 in the table for ASIL-B and residual fault diagnostic coverage < 90%.	FRClass2

### Enumeration HWSPFTargetFailureRateClassEnum

*Element Base Classes:*

*Element Notes:*

ISO 26262 Part 5 9.4.3.5 -Table 7 (Targets of failure rate classes of hardware parts regarding single-point faults)

DM: Dedicated measures

Additionally, OUT-OF-SCOPE was added.

**Attributes**

Attribute	Notes	Default
<b>OutOfScope</b> String	This literal describes values which are out of scope for the analysis.	Not Relevant
<b>ASIL_D</b> String	This literal describes a single cell with value target failure rate class 1 + dedicated measures in the table for ASIL-D.	FRClass1 + DM
<b>ASIL_C</b> String	This literal describes a single cell with value target failure rate class 2 + dedicated measures or failure rate class 1 in the table for ASIL-C.	(FRClass2 + DM) or FRClass1
<b>ASIL_B</b> String	This literal describes a single cell with value target failure rate class 2 or failure rate class 1 in the table for ASIL-B.	FRClass2 or FRClass1

### Enumeration HWTargetValuesPMHFFEnum

*Element Base Classes:*

*Element Notes:*

Target values for PMHF according to ISO 26262 Part 5 9.4.2.1. The values here are described in FIT (ppm/h) or FIT.

$\text{ASIL-D} = 1.10^{-8} \text{ h}^{-1} = 10 \text{ ppm/h}$

$\text{ASIL-C} = \text{ASIL-B} = 1.10^{-7} \Rightarrow 100 \text{ ppm/h}$

#### **Attributes**

Attribute	Notes	Default
<b>ASIL_D</b> Float	This attribute stores target value for PMHF for ASIL-D.	10.0
<b>ASIL_C</b> Float	This attribute stores target value for PMHF for ASIL-C.	100.0
<b>ASIL_B</b> Float	This attribute stores target value for PMHF for ASIL-B.	100.0

#### **Enumeration HWValuesFailureRateClassEnum**

*Element Base Classes:*

*Element Notes:*

FailureRateClass value correspond to the maximum value applied in the Failure Rate Class X considering that lower value is Class X-1 (and 0 for class 1). The failure rate class values are determined according to ISO 26262 Part 5 9.4.3.3.

Failure Class are based on the number of relevant cutset.

#### **Attributes**

Attribute	Notes	Default
<b>FailureRateClass1</b> Float	This attribute contains the maximum value for failure rate class 1 ranking (in FIT).  It is computed from the allocated FIT rate to the analysis (as targetValue of HWFailureClassContainer) derided by the number of relevant cut-set of the analysis (as relevantCutSet of HWFailureClassContainer)	FR_TargetValue / relevantCutSet
<b>FailureRateClass2</b> Float	This attribute contains the maximum value for failure rate class 2 ranking (in FIT).	FailureRateClass1 * 10

Attribute	Notes	Default
<b>FailureRateClass3</b> Float	This attribute contains the maximum value for failure rate class 3 ranking (in FIT).	FailureRateClass2 * 10
<b>FailureRateClass4</b> Float	This attribute contains the maximum value for failure rate class 4 ranking (in FIT).	FailureRateClass3 * 10
<b>FailureRateClass5</b> Float	This attribute contains the maximum value for failure rate class 5 ranking (in FIT).	FailureRateClass4 * 10

## Package Hazards

Package Notes:

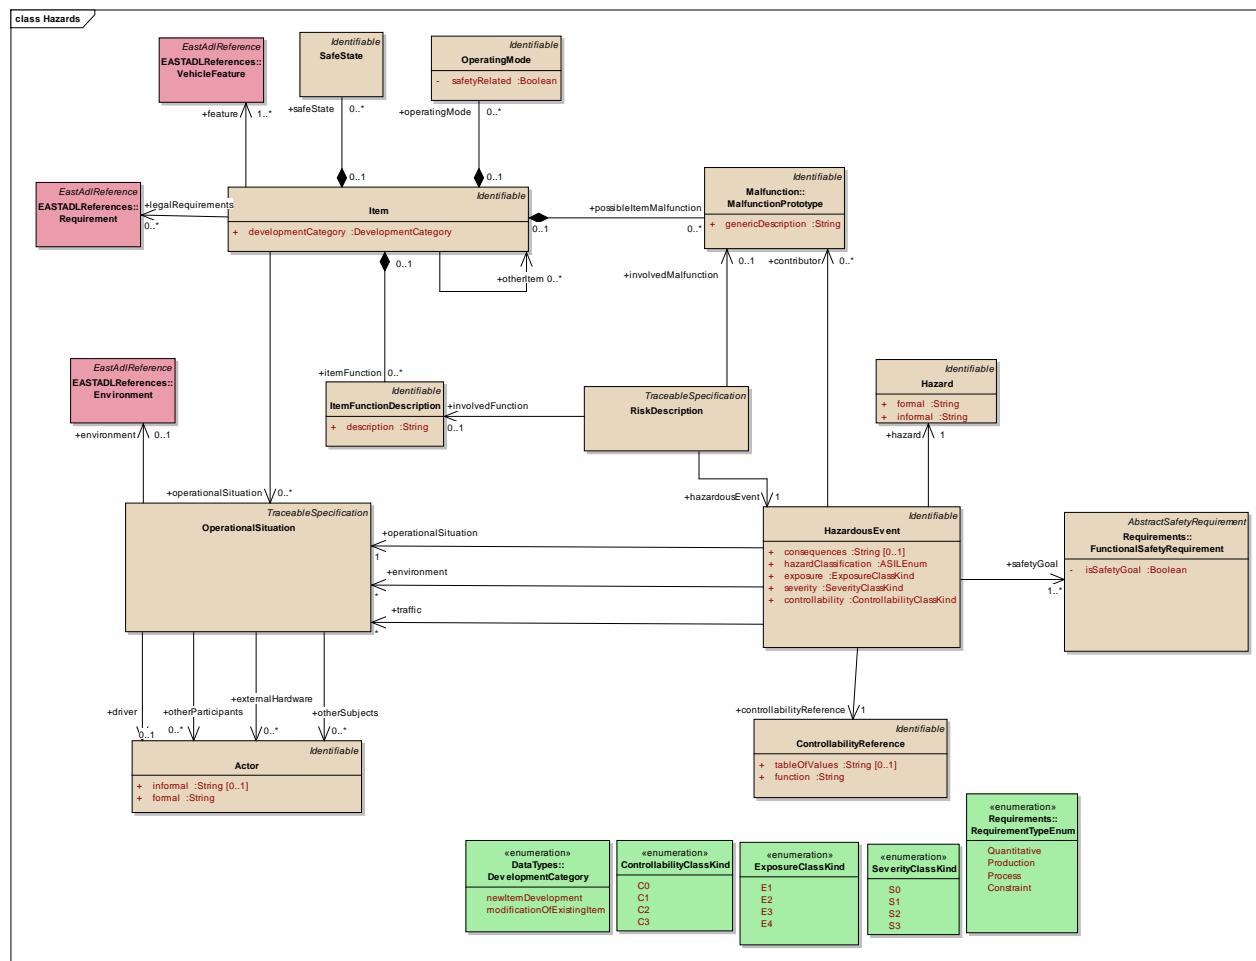

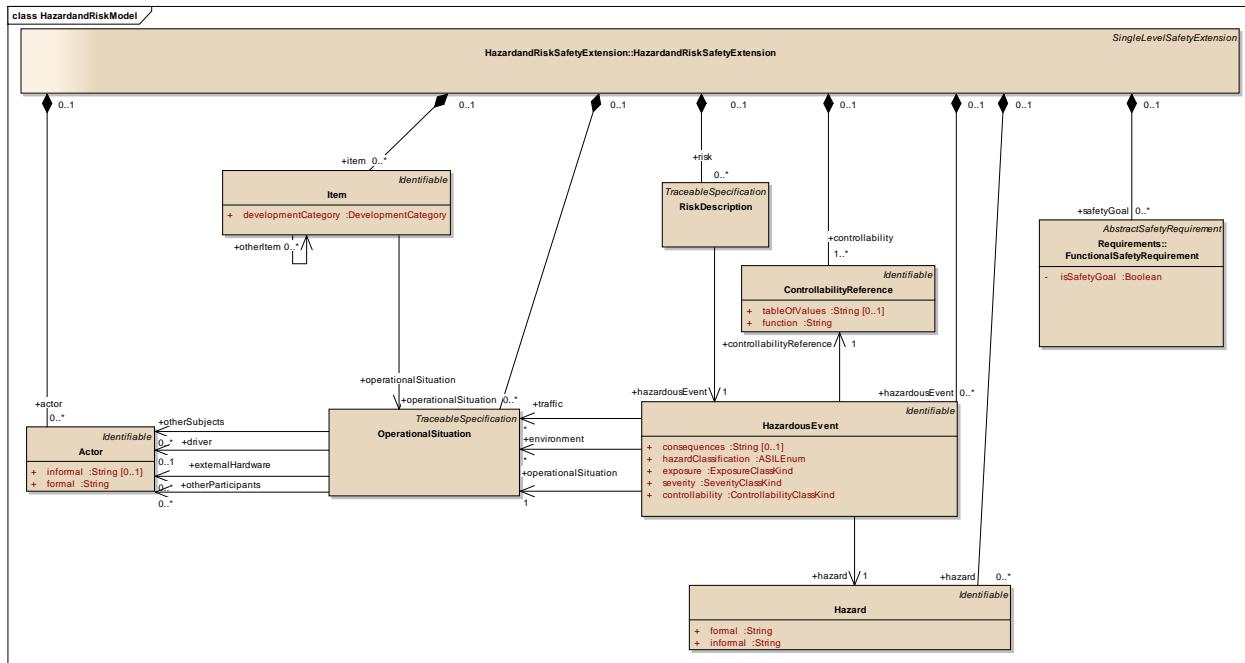

Figure 42: Hazards - (Class diagram)

**Diagram Notes:**Figure 43: **HazardandRiskModel** - (Class diagram)**Diagram Notes:****Class Actor****Element Base Classes:** **Identifiable****Element Notes:**

The “Actor” class is an abstract class which provides the structure that is needed for the contributions of different actors to the operational situation and the hazard.

**Note:**

The risk assessment of hazardous events focuses on the harm to each person potentially at risk – including the driver or the passengers of the vehicle causing the hazardous event, and other persons potentially at risk such as cyclists, pedestrians or occupants of other vehicles.

**Reference:**

ISO26262-3-7.4.3.2

**Class Hazard**

*Element Base Classes:* Identifiable

***Element Notes:***

A hazard describes a potential source of harm. Important is that it is formulated in terms of behavior that can be observed on vehicle level.

Hazards shall be defined in terms of the conditions or behavior that can be observed at the vehicle level.

The hazards shall be determined systematically by using adequate techniques, such as brainstorming, checklists, quality history, FMEA and field studies.

***Reference:***

<b>exposure</b> ExposureClassKind	<b>Exposure</b> is defined as the state of being in an <b>operational situation</b> that can be <b>hazardous</b> if coincident with the <b>failure mode</b> under analysis  <i>Reference:</i> ISO 26262-1-1.37 ISO 26262-1-1.83 ISO 26262-1-1.57 ISO 26262-1-1.40	
<b>severity</b> SeverityClassKind	<b>Severity</b> is defined as the estimation of the extent of <b>harm</b> to one or more individuals that can occur in a potentially <b>hazardous</b> situation  <i>Reference:</i> ISO 26262-1-1.120 ISO 26262-1-1.56 ISO 26262-1-1.57	
<b>controllability</b> ControllabilityClassKind	<b>Controllability</b> is defined as the ability to avoid a specified <b>harm</b> or damage through the timely reactions of the persons involved, possibly with support from <b>external measures</b>  <i>NOTE:</i> 1. Persons involved can include the driver, passengers or persons in the vicinity of the vehicle's exterior. 2. The parameter C in <b>hazard analysis and risk assessment</b> represents the potential for controllability.  <i>Reference:</i> ISO 26262-1.19 ISO 26262-1.56 ISO 26262-1.38 ISO 26262-1.58	

## Class Item

Element Base Classes: [Identifiable](#)

***Element Notes:***

The item is, according to ISO 26262, a “system or array of systems to implement a function at the vehicle level, to which ISO 26262 is applied”. It is associated with the FunctionType since this class already allows decomposition of the function.

Note: E/E technology components in an other item are called "external measure".

<b><u>Generalization</u></b> Source -> Destination	HardwareSafetyRequirement	AbstractQuantifiableSafetyRequirement

## **Abstract AbstractSafetyRequirement**

*Element Base Classes:* **AllocatableElement, TraceableSpecification**

*Element Notes:*

In the SAFE meta model AbstractSafetyRequirement is used as the abstract superclass for

- SafetyGoals,
- FunctionalSafetyRequirements and
- TechnicalSafetyRequirements.

**Connections**

**Class FunctionalSafetyRequirement***Element Base Classes:* AbstractSafetyRequirement*Element Notes:*

FunctionalSafetyRequirements are used to specify

- implementation-independent safety behavior
- implementation-independent safety measures.

FunctionalSafetyRequirements shall contain safety-related attributes.

At least one functional safety requirement shall be specified for each safety goal.

FunctionalSafetyRequirements are allocated to the FunctionComponent of the item.

A safety goal shall be determined for each hazardous event with an ASIL evaluated in the hazard analysis. If similar safety goals are determined, these may be combined into one safety goal.

*Constraint:*

HasAsilDecomposed shall only be set if attribute redundancy is set true.

<b><u>Generalization</u></b> Source -> Destination	Verify	RequirementsRelationship
<b><u>Aggregation</u></b> Source -> Destination	RequirementsRelationship	SafetyExtension

**Class SafetyConcept***Element Base Classes:* **AbstractSafetyRequirement***Element Notes:*

This container provides the possibility to group different requirements belonging to the realization of a safety concept. For example, a functional safety concept consisting of requirements specifying what kind of error detection must be done and what kind of handling for detected errors must be done.

Furthermore, the container provides two attributes relevant for safety concepts, fault tolerant time interval (FTTI) and emergency operation time interval. These attributes can be used to derive the time quantum allocated to each requirement belonging to the concept.

## Class TechnicalSafetyRequirement

*Element Base Classes:* AbstractQuantifiableSafetyRequirement

*Element Notes:*

TechnicalSafetyRequirements are used to specify the implementation of the associated FunctionComponent . They are derived by the allocated FunctionalSafetyRequirements.

TechnicalSafetyRequirements include the specification of safety-related failure mitigation.

The technical safety requirements specification refines the functional safety concept, considering both the functional concept and the preliminary architectural assumptions

The technical safety requirements are allocated to hardware and software, and, if applicable, on other technologies

## **Package FunctionalSafetyRequirements**

*Package Notes:*

## ***Package WarningAndDegradation***

*Package Notes:*

Figure 46: WarningAndDegradation - (Class diagram)***Diagram Notes:*****Class WarningAndDegradation*****Element Base Classes:*** FunctionalSafetyRequirement***Element Notes:***

The warning- and degradation concept is a specification of how to alert the driver of potentially reduced functionality and of how to provide this reduced functionality to reach a safe state.

The warning and degradation concept shall be specified by FunctionalSafetyRequirements

The warning- and degradation-concept describes the system transition of the system in case of occurrence of a safety relevant failure to the safe state that is defined for that failure.

The warn- and degradation-concept also contains functional safety requirements. The functional safety requirements of the warn- and degradation-concept shall be allocated to the safe state that shall be reached.

The functional safety requirements of the warn- and degradation-concept shall be classified with the same ASIL as the allocated safe state.

The exit condition of the safe state back to the normal operation mode is also part of the warn-and degradation-concept.

## Package SafetyCase

Package Notes:

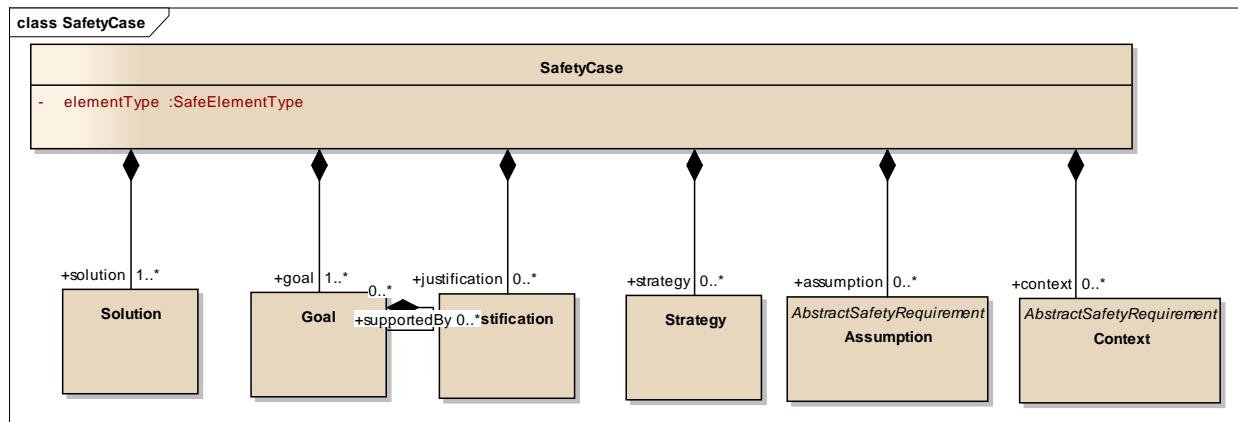

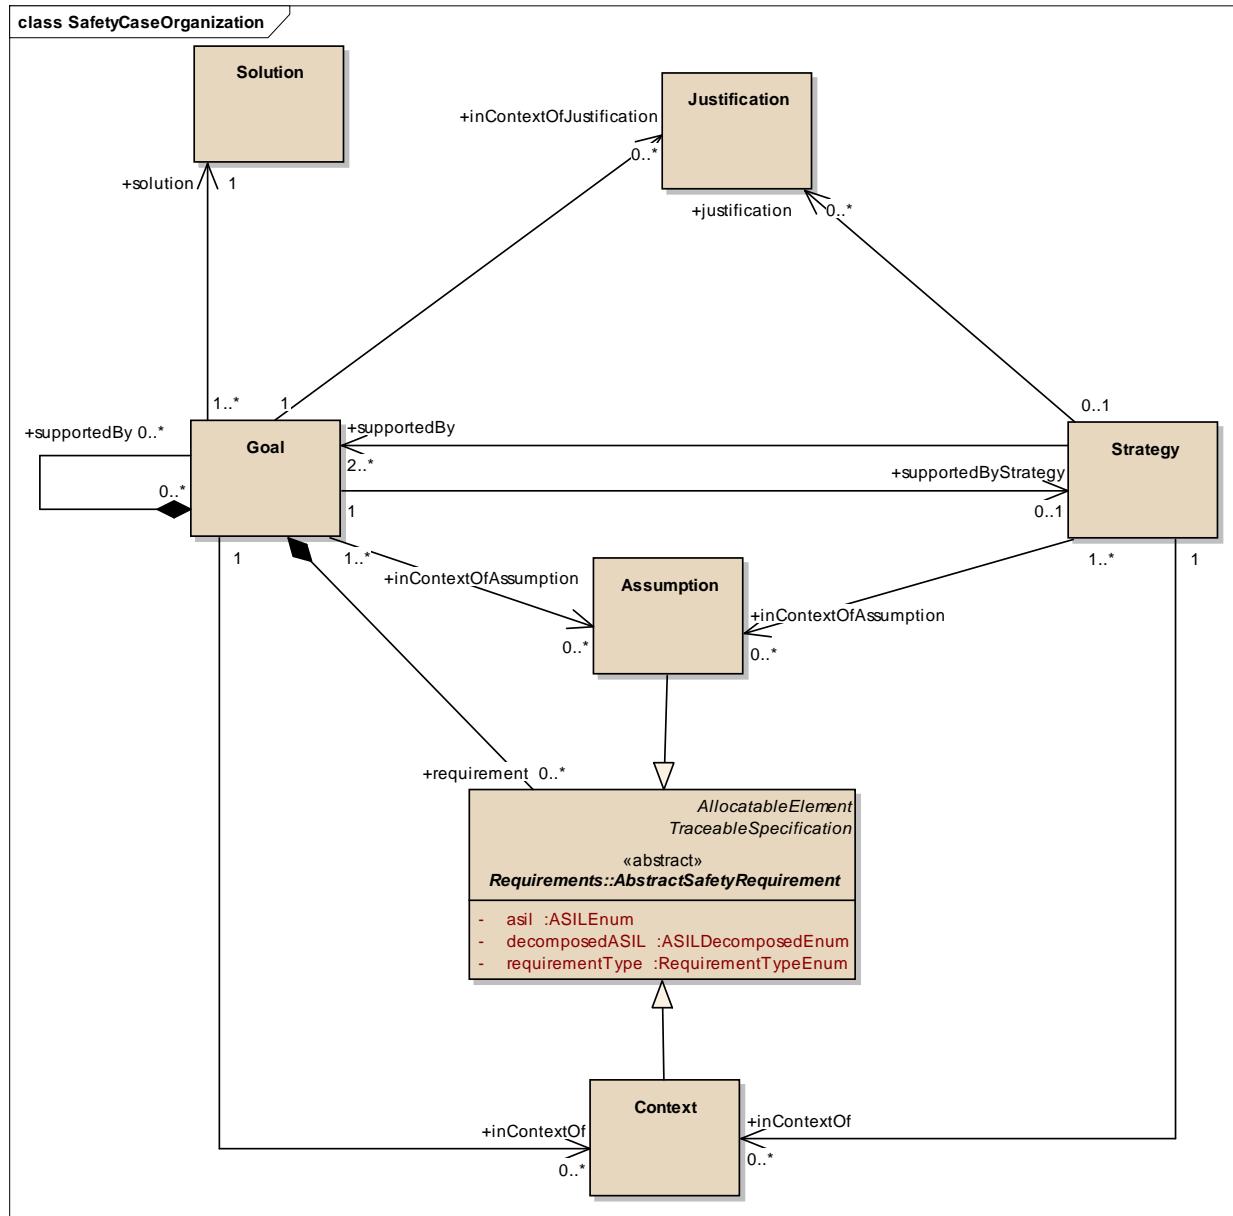

Figure 47: SafetyCase - (Class diagram)

Diagram Notes:

Figure 48: SafetyCaseOrganization - (Class diagram)

*Diagram Notes:*

### Class Assumption

*Element Base Classes:* AbstractSafetyRequirement

*Element Notes:*

- An assumption is an intentionally unsubstantiated statement. The scope of an assumption is the entire argument. Having connected an assumption to a goal, the assumption is taken to be connected to the

entirety of the argument supporting this goal.

- Therefore, it is not necessary to restate the assumption in the supporting argument.
- rendered as an oval with the letter 'A' at the bottom-right.

### Connections

Connector	Source	Target
<b><u>Association</u></b> Source -> Destination	Goal	Assumption
<b><u>Aggregation</u></b> Source -> Destination	Assumption	SafetyCase
<b><u>Generalization</u></b> Source -> Destination	Assumption	AbstractSafetyRequirement
<b><u>Association</u></b> Source -> Destination	Strategy	Assumption

### Class Context

Element Base Classes: **AbstractSafetyRequirement**

*Element Notes:*

- Claims can only be asserted to be true in a specified context. Context elements are used to make this relationship clear.
- A ***context***, rendered as an oblong rectangle with rounded out sides, presents a contextual artifact. This can be a reference to contextual information, or a statement.
- Where used, contexts define or constrain the scope over which the claim is made.

### Connections

Connector	Source	Target
<b><u>Association</u></b> Source -> Destination	Goal	Context
<b><u>Association</u></b> Source -> Destination	Strategy	Context
<b><u>Generalization</u></b>	Context	AbstractSafetyRequirement

Connector	Source	Target
Source -> Destination		
<b><u>Aggregation</u></b>	Context	SafetyCase
Source -> Destination		

## **Class Goal**

*Element Base Classes:*

*Element Notes:*

- rendered as a rectangle,
- presents a claim forming part of the argument.
- One or more sub-goals may be declared for a given goal. This structure then asserts that if the claims presented in the sub-goals are true, this is sufficient to establish that the claim in the main goal is true.

## **Connections**

<b><u>Association</u></b>	Goal	Strategy
Source -> Destination		

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	Goal	Goal

## **Class Justification**

*Element Base Classes:*

*Element Notes:*

- rendered as an oval with the letter 'J' at the bottom-right,
- presents a statement of rationale,
- and does not alter the meaning of the claim made in the goal, but provides rationale for its inclusion or its phrasing.
- Should an equivalent justification be required elsewhere in the argument, it will need to be re-stated or re-linked.

## **Connections**

Connector	Source	Target
<u>Association</u> Source -> Destination	Goal	Justification
<u>Aggregation</u> Source -> Destination	Justification	SafetyCase

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	ActuatorErrorDetection	Detect

#### **Class ActuatorMonitor**

*Element Base Classes:* **SoftwareSafetyRequirement**

*Element Notes:*

This meta-class represents the actuator monitor requirement. It extends the meta-class SSR from SAFE meta model.

To define an actuator monitor requirement the engineer has to reference the monitored actuator through the ActuatorMonitor attribute actuator and the inputs through which the monitoring occurs, using the attribute sensors. Furthermore, the engineer has to specify an evaluation function which maps input from sensors to the provided actuator output.

#### Connections

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	ActuatorMonitor	SoftwareSafetyRequirement
<b><u>Generalization</u></b> Source -> Destination	AutosarActuatorMonitor	ActuatorMonitor

**Class CRCErrorDetection***Element Base Classes:* [Detect](#)*Element Notes:***Connections**

Connector	Source	Target
<b>Generalization</b>	CRCErrorDetection	Detect
Source -> Destination		

**Class CRCFailed***Element Base Classes:* [Situation](#)

*Element Notes:***Connections**

Connector	Source	Target
<b><u>Generalization</u></b>	CRCFailed	Situation
Source -> Destination		

**Class ComponentPrototypeCRC***Element Base Classes:* AutosarCRC*Element Notes:*

This meta-class is the specialization of the abstract SSR CRC which is deployed for a specific instance of a component providing a given interface.

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b>	ComponentPrototypeCRC	AutosarCRC
Source -> Destination		
<b><u>Aggregation</u></b>	AutosarVariableDataPrototypeInstanceRef	ComponentPrototypeCRC
Source -> Destination		

**Class InterfaceCRC***Element Base Classes:* AutosarCRC*Element Notes:*

This meta-class is the specialization of the CRC SSR deployed as the property of data elements of a given interface. This means the CRC is a property of the interface and not of a specific instance (realization) of the interface.

### Connections

Connector	Source	Target
<u>Generalization</u> Source -> Destination	InterfaceCRC	AutosarCRC
<u>Association</u> Source -> Destination	InterfaceCRC	VariableDataPrototype

### Package Comparison

#### Package Notes:

This package groups the elements related to the software safety mechanism comparison

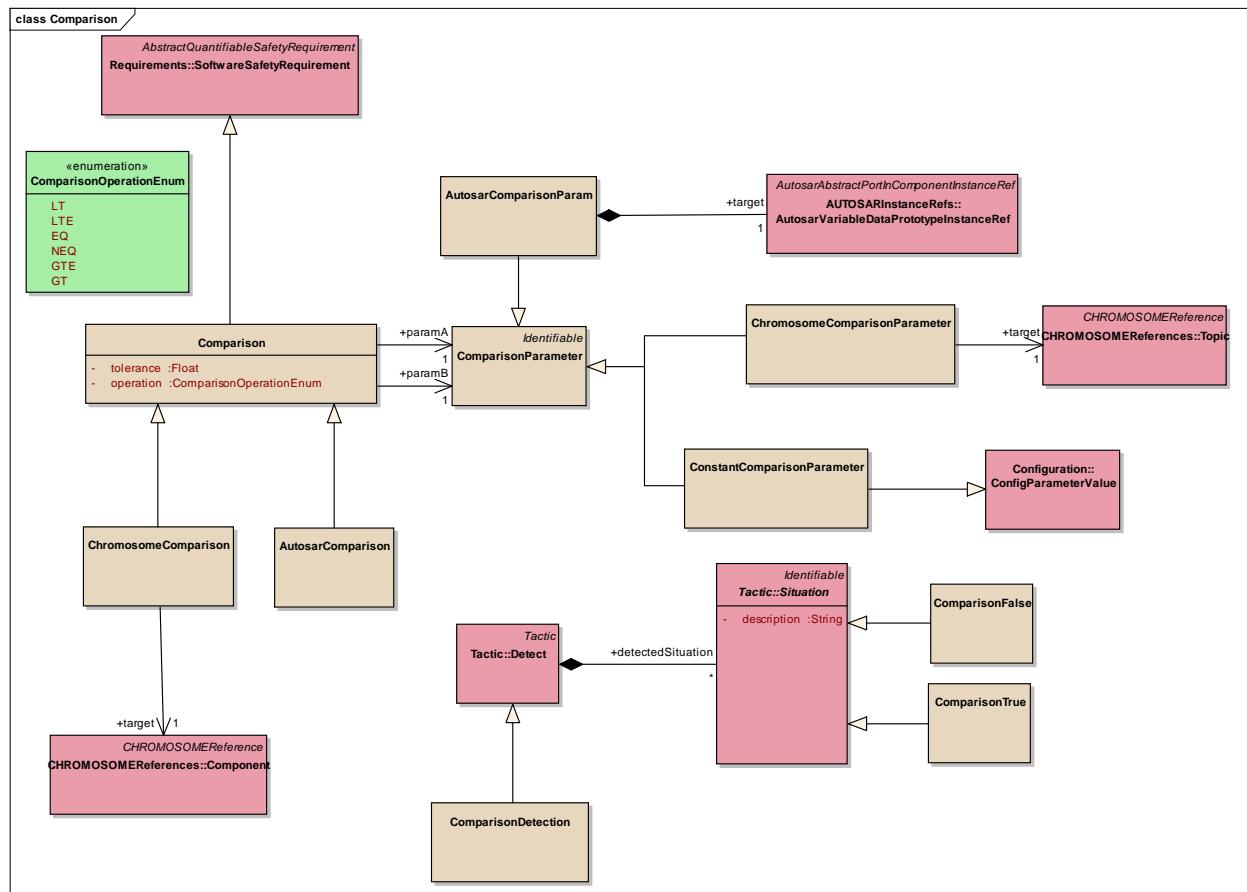

Figure 54: Comparison - (Class diagram)

#### Diagram Notes:

## Class AutosarComparison

*Element Base Classes:* Comparison

*Element Notes:*

AUTOSAR specific comparison SSR. The compared values are provided as AUTOSAR variable instance references and the operation applied to inputs is defined through the Operation enumeration.

### Connections

Connector	Source	Target
<u>Generalization</u> Source -> Destination	AutosarComparison	Comparison

## Class AutosarComparisonParam

*Element Base Classes:* ComparisonParameter

*Element Notes:*

AUTOSAR specific comparison parameters. Allows to reference AUTOSAR elements used in the comparison.

### Connections

Connector	Source	Target
<u>Generalization</u> Source -> Destination	AutosarComparisonParam	ComparisonParameter
<u>Aggregation</u> Source -> Destination	AutosarVariableDataPrototypeInstanceRef	AutosarComparisonParam

## Class ChromosomeComparison

*Element Base Classes:* Comparison

*Element Notes:*

Chromosome comparison is referencing a specific Chromosome component instance, which is implementing comparison of one or multiple topics.

#### Connections

Connector	Source	Target
<u>Generalization</u> Source -> Destination	ChromosomeComparison	Comparison
<u>Association</u> Source -> Destination	ChromosomeComparison	Component

#### Class ChromosomeComparisonParameter

*Element Base Classes:* ComparisonParameter

*Element Notes:*

Chromosome specific comparison parameter. Allows to reference a specific Chromosome topic, which acts as a comparison entity.

#### Connections

Connector	Source	Target
<u>Generalization</u> Source -> Destination	ChromosomeComparisonParameter	ComparisonParameter
<u>Association</u> Source -> Destination	ChromosomeComparisonParameter	Topic

#### Class Comparison

*Element Base Classes:* SoftwareSafetyRequirement

*Element Notes:*

Value comparison SSR.

#### Connections

Connector	Source	Target
<u>Generalization</u> Source -> Destination	AutosarComparison	Comparison
<u>Association</u> Source -> Destination	Comparison	ComparisonParameter
<u>Association</u> Source -> Destination	Comparison	ComparisonParameter
<u>Generalization</u> Source -> Destination	ChromosomeComparison	Comparison
<u>Generalization</u> Source -> Destination	Comparison	SoftwareSafetyRequirement

**Attributes**

Attribute	Notes	Default
<b>tolerance</b> Float		
<b>operation</b> ComparisonOperationEnum		

**Class ComparisonDetection***Element Base Classes:* **Detect***Element Notes:***Connections**

Connector	Source	Target
<u>Generalization</u> Source -> Destination	ComparisonDetection	Detect

**Class ComparisonFalse***Element Base Classes:* **Situation**

*Element Notes:*

**Connections**

Connector	Source	Target
<u>Generalization</u>	ComparisonFalse	Situation
Source -> Destination		

**Enumeration ComparisonOperationEnum**

*Element Base Classes:*

*Element Notes:*

Enumeration providing the valid operations for a comparison SSR.

**Attributes**

Attribute	Notes	Default
LT		
LTE		
EQ		
NEQ		
GTE		
GT		

**Class ComparisonParameter**

*Element Base Classes:* Identifiable

***Element Notes:***

Abstract comparison parameter element.

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	ChromosomeComparisonParameter	ComparisonParameter
<b><u>Generalization</u></b> Source -> Destination	ConstantComparisonParameter	ComparisonParameter
<b><u>Association</u></b> Source -> Destination	Comparison	ComparisonParameter
<b><u>Generalization</u></b> Source -> Destination	AutosarComparisonParam	ComparisonParameter
<b><u>Association</u></b> Source -> Destination	Comparison	ComparisonParameter
<b><u>Generalization</u></b> Source -> Destination	ComparisonParameter	Identifiable

**Class ComparisonTrue**

*Element Base Classes:* **Situation**

***Element Notes:*****Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	ComparisonTrue	Situation

**Class ConstantComparisonParameter**

*Element Base Classes:* [ComparisonParameter](#), [ConfigParameterValue](#)

### *Element Notes:*

## Connections

Connector	Source	Target
<u>Generalization</u> Source -> Destination	ConstantComparisonParameter	ConfigParameterValue
<u>Generalization</u> Source -> Destination	ConstantComparisonParameter	ComparisonParameter

## **Package ContextRangeCheck**

### *Package Notes:*

This package groups the elements related to the software safety mechanism Context Range Check

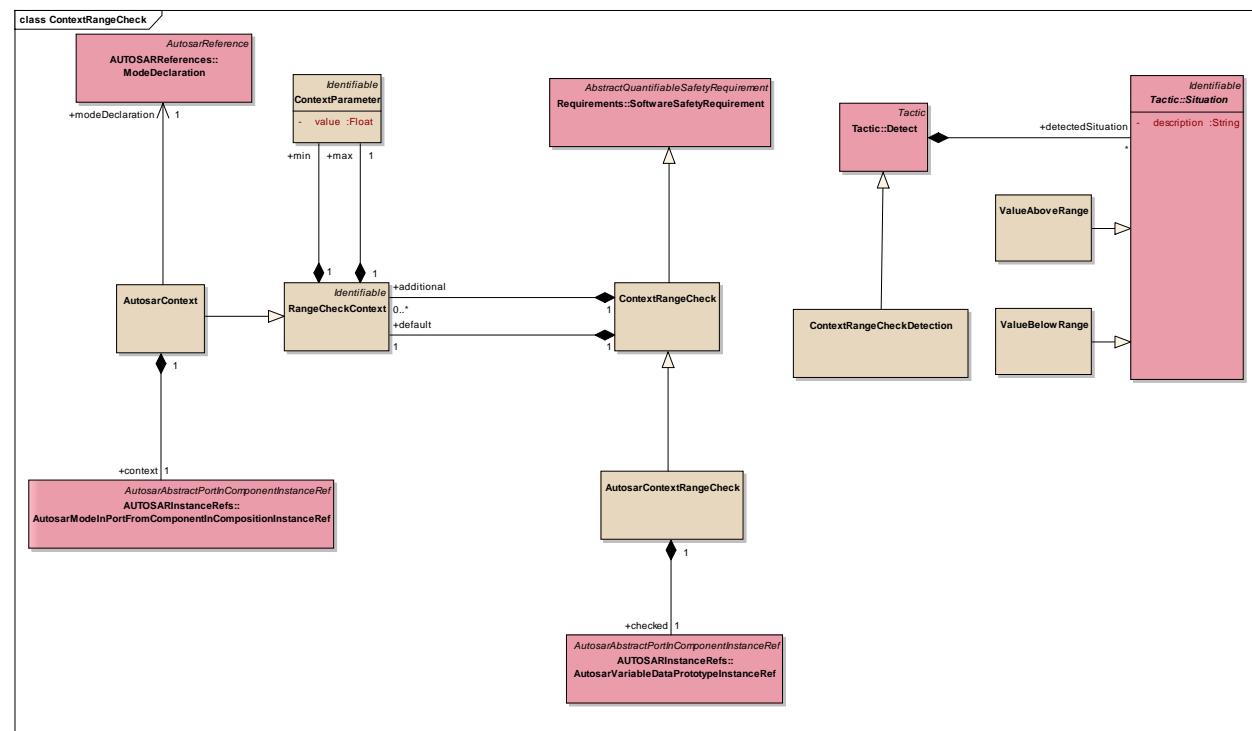

Figure 55: **ContextRangeCheck** - (*Class diagram*)

*Diagram Notes:***Class AutosarContext***Element Base Classes:* **RangeCheckContext***Element Notes:*

AUTOSAR specific meta class for defining the context used by the range check SSR.

**Connections**

Connector	Source	Target
<b><u>Aggregation</u></b> Source -> Destination	AutosarModeInPortFromComponentInCompositionInstanceRef	AutosarContext
<b><u>Association</u></b> Source -> Destination	AutosarContext	ModeDeclaration
<b><u>Generalization</u></b> Source -> Destination	AutosarContext	RangeCheckContext

**Class AutosarContextRangeCheck***Element Base Classes:* **ContextRangeCheck***Element Notes:*

AUTOSAR specific meta class defining the context range check SSR.

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	AutosarContextRangeCheck	ContextRangeCheck
<b><u>Aggregation</u></b> Source -> Destination	AutosarVariableDataPrototypeInstanceRef	AutosarContextRangeCheck

**Class ContextParameter***Element Base Classes:* **Identifiable***Element Notes:*

Provides the valid range parameters for a given context.

**Connections**

Connector	Source	Target
<b><u>Aggregation</u></b> Source -> Destination	ContextParameter	RangeCheckContext
<b><u>Aggregation</u></b> Source -> Destination	ContextParameter	RangeCheckContext
<b><u>Generalization</u></b> Source -> Destination	ContextParameter	Identifiable

**Attributes**

Attribute	Notes	Default
<b>value</b> Float		

**Class ContextRangeCheck***Element Base Classes:* **SoftwareSafetyRequirement***Element Notes:*

This meta-class defines a range check SSR whose range is defined based on the current system/component context (e.g. AUTOSAR mode).

**Connections**

Connector	Source	Target
<b><u>Aggregation</u></b> Source -> Destination	RangeCheckContext	ContextRangeCheck
<b><u>Generalization</u></b>	AutosarContextRangeCheck	ContextRangeCheck

Connector	Source	Target
Source -> Destination		
<b>Aggregation</b> Source -> Destination	RangeCheckContext	ContextRangeCheck
<b>Generalization</b> Source -> Destination	ContextRangeCheck	SoftwareSafetyRequirement

**Class ContextRangeCheckDetection***Element Base Classes:* **Detect***Element Notes:***Connections**

Connector	Source	Target
<b>Generalization</b> Source -> Destination	ContextRangeCheckDetection	Detect

**Class RangeCheckContext***Element Base Classes:* **Identifiable***Element Notes:*

Defines the parameters used by the range check SSR when the system is in a given AUTOSAR mode.

**Connections**

Connector	Source	Target
<b>Generalization</b> Source -> Destination	AutosarContext	RangeCheckContext
<b>Aggregation</b> Source -> Destination	ContextParameter	RangeCheckContext

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	ContextParameter	RangeCheckContext
<u>Aggregation</u> Source -> Destination	RangeCheckContext	ContextRangeCheck
<u>Generalization</u> Source -> Destination	RangeCheckContext	Identifiable
<u>Aggregation</u> Source -> Destination	RangeCheckContext	ContextRangeCheck

**Class ValueAboveRange***Element Base Classes:* Situation*Element Notes:***Connections**

Connector	Source	Target
<u>Generalization</u> Source -> Destination	ValueAboveRange	Situation

**Class ValueBelowRange***Element Base Classes:* Situation*Element Notes:***Connections**

Connector	Source	Target
<u>Generalization</u> Source -> Destination	ValueBelowRange	Situation

## Package CpuSelfTest

### Package Notes:

This package groups the elements related to the software safety mechanism CPU Self Test

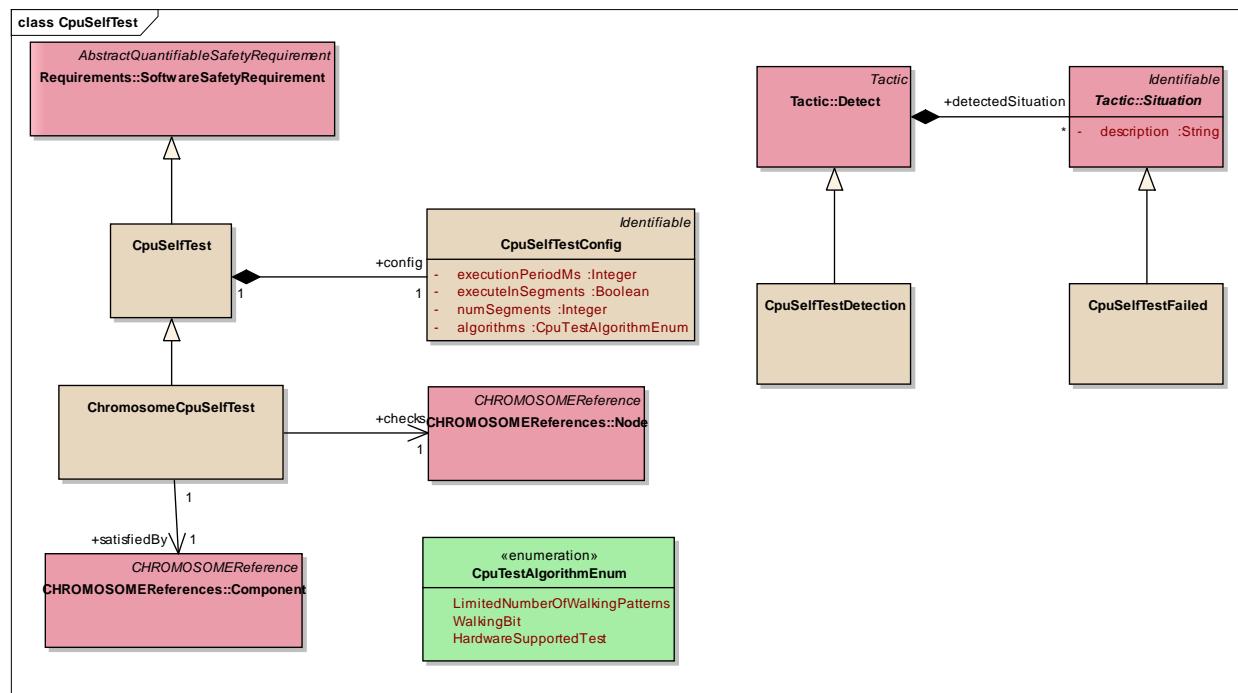

Figure 56: CpuSelfTest - (Class diagram)

### Diagram Notes:

#### Class ChromosomeCpuSelfTest

Element Base Classes: CpuSelfTest

### Element Notes:

CHROMOSOME specific CPU self-test meta class.

### Connections

Connector	Source	Target
-----------	--------	--------

Connector	Source	Target
<u>Association</u> Source -> Destination	ChromosomeCpuSelfTest	Component
<u>Generalization</u> Source -> Destination	ChromosomeCpuSelfTest	CpuSelfTest
<u>Association</u> Source -> Destination	ChromosomeCpuSelfTest	Node

## Class CpuSelfTest

*Element Base Classes:* SoftwareSafetyRequirement

*Element Notes:*

This meta-class element defines a CPU self-test SSR. The entity implementing such an SSR is executed periodically according to its configuration, and may trigger error handlers in case of error detection.

### Connections

Connector	Source	Target
<u>Generalization</u> Source -> Destination	CpuSelfTest	SoftwareSafetyRequirement
<u>Generalization</u> Source -> Destination	ChromosomeCpuSelfTest	CpuSelfTest
<u>Aggregation</u> Source -> Destination	CpuSelfTestConfig	CpuSelfTest

## Class CpuSelfTestConfig

*Element Base Classes:* Identifiable

*Element Notes:*

Configuration meta class to configure CPU test SSR.

### Connections

Connector	Source	Target
<u>Generalization</u> Source -> Destination	CpuSelfTestConfig	Identifiable
<u>Aggregation</u> Source -> Destination	CpuSelfTestConfig	CpuSelfTest

**Attributes**

Attribute	Notes	Default
<b>executionPeriodMs</b> Integer		
<b>executeInSegments</b> Boolean		
<b>numSegments</b> Integer		
<b>algorithms</b> CpuTestAlgorithmEnum		

**Class CpuSelfTestDetection***Element Base Classes:* **Detect***Element Notes:***Connections**

Connector	Source	Target
<u>Generalization</u> Source -> Destination	CpuSelfTestDetection	Detect

**Class CpuSelfTestFailed***Element Base Classes:* **Situation***Element Notes:*

**Connections**

Connector	Source	Target
<b>Generalization</b> Source -> Destination	CpuSelfTestFailed	Situation

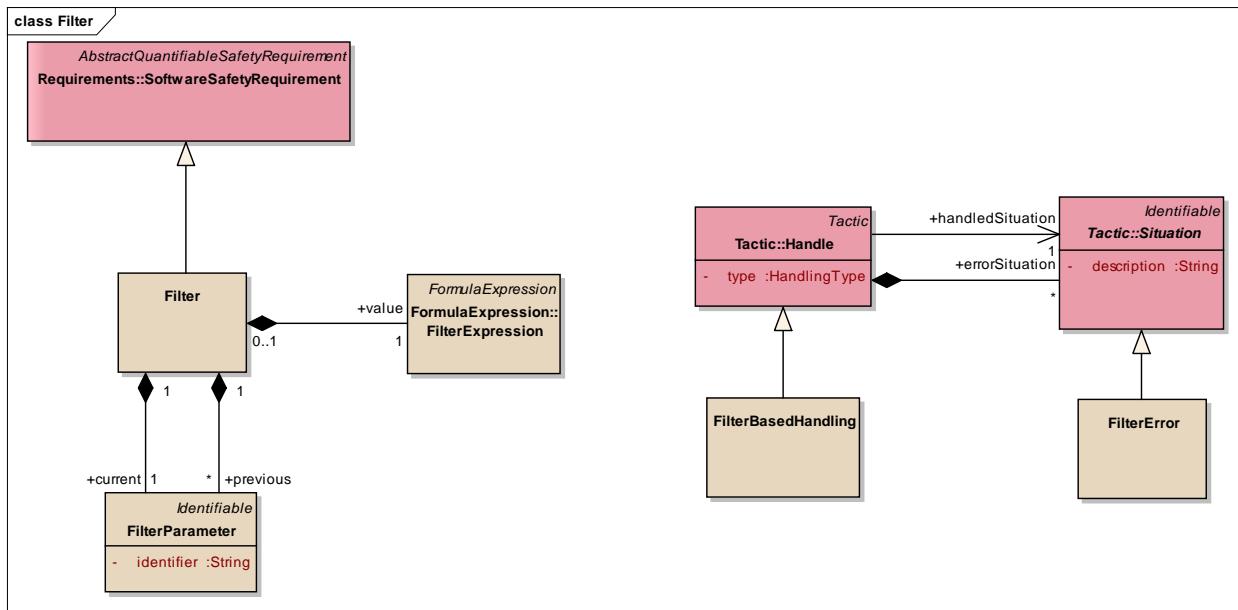

**Enumeration CpuTestAlgorithmEnum***Element Base Classes:**Element Notes:*

Defines possible CPU test algorithms.

**Attributes**

Attribute	Notes	Default
<b>LimitedNumberOfWalkin gPatterns</b>		
<b>WalkingBit</b>		
<b>HardwareSupportedTest</b>		

**Package Filter***Package Notes:*

Figure 57: Filter - (Class diagram)

*Diagram Notes:*

### Class Filter

*Element Base Classes:* SoftwareSafetyRequirement

*Element Notes:*

The Filter meta element represents an error handling specification which defines how an erroneous value provided to it can be corrected. The mechanism can be referred by detection software safety requirements.

### Connections

Connector	Source	Target
<u>Generalization</u>	Filter	SoftwareSafetyRequirement
Source -> Destination		
<u>Aggregation</u>	FilterParameter	Filter
Source -> Destination		
<u>Aggregation</u>	FilterParameter	Filter
Source -> Destination		
<u>Aggregation</u>	FilterExpression	Filter
Source -> Destination		

**Class FilterBasedHandling***Element Base Classes:* **Handle***Element Notes:***Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	FilterBasedHandling	Handle

**Class FilterError***Element Base Classes:* **Situation***Element Notes:***Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	FilterError	Situation

**Class FilterParameter***Element Base Classes:* **Identifiable***Element Notes:*

A FilterParameter meta element defines the possible values which can be referred within a Filter. These are used to calculate and correct erroneous values provided to a filter realization.

***Connections***

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	FilterParameter	Filter
<u>Generalization</u> Source -> Destination	FilterParameter	Identifiable
<u>Aggregation</u> Source -> Destination	FilterParameter	Filter

***Attributes***

Attribute	Notes	Default
<b>identifier</b> String		

***Package GradientCheck******Package Notes:***

This package groups the elements related to the software safety mechanism Gradient Check

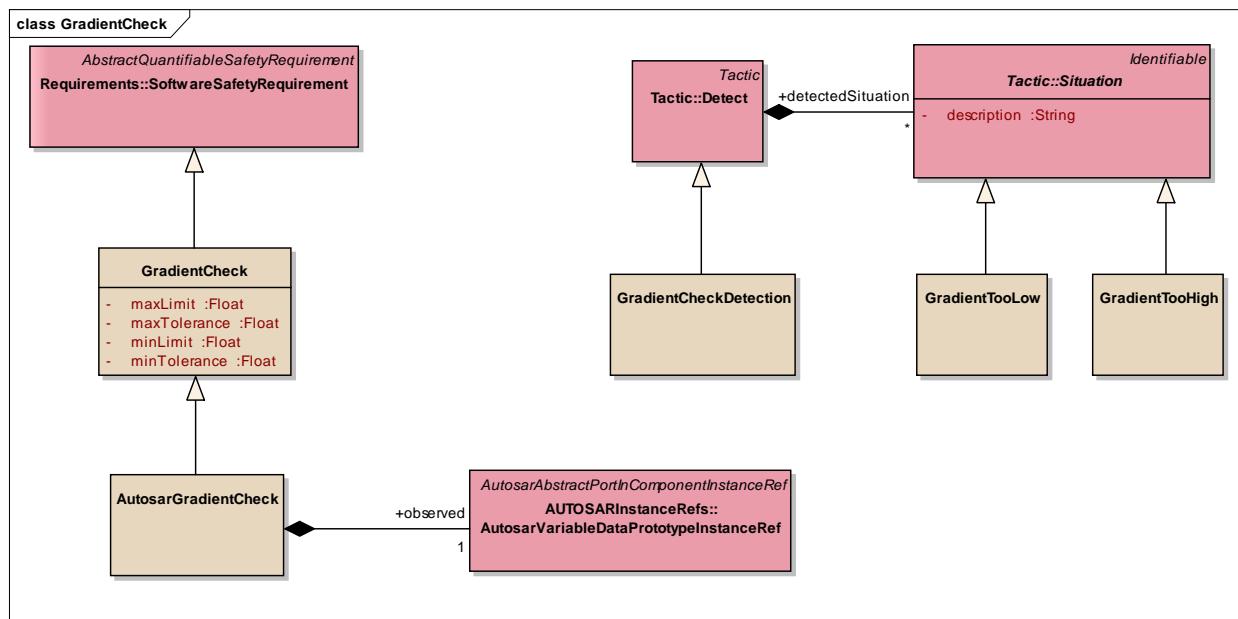

Figure 58: GradientCheck - (Class diagram)

***Diagram Notes:***

## **Class AutosarGradientCheck**

*Element Base Classes:* **GradientCheck**

*Element Notes:*

AUTOSAR specific meta class for defining the gradient check SSR.

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	AutosarGradientCheck	GradientCheck
<b><u>Aggregation</u></b> Source -> Destination	AutosarVariableDataPrototypeInstanceRef	AutosarGradientCheck

## **Class GradientCheck**

*Element Base Classes:* **SoftwareSafetyRequirement**

*Element Notes:*

This meta-class element defines a gradient check SSR. The limit and tolerance attributes are used to check if the values are varying within a valid range. The SSR is executed periodically according to its period attribute.

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	AutosarGradientCheck	GradientCheck
<b><u>Generalization</u></b> Source -> Destination	GradientCheck	SoftwareSafetyRequirement

**Attributes**

Attribute	Notes	Default
<b>maxLimit</b>		

Attribute	Notes	Default
Float		
<b>maxTolerance</b>		
Float		
<b>minLimit</b>		
Float		
<b>minTolerance</b>		
Float		

**Class GradientCheckDetection***Element Base Classes:* **Detect***Element Notes:***Connections**

Connector	Source	Target
<b>Generalization</b>	GradientCheckDetection	Detect
Source -> Destination		

**Class GradientTooHigh***Element Base Classes:* **Situation***Element Notes:***Connections**

Connector	Source	Target
<b>Generalization</b>	GradientTooHigh	Situation
Source -> Destination		

## Class GradientTooLow

Element Base Classes: Situation

Element Notes:

### Connections

Connector	Source	Target
<u>Generalization</u> Source -> Destination	GradientTooLow	Situation

## Package HealthMonitor

Package Notes:

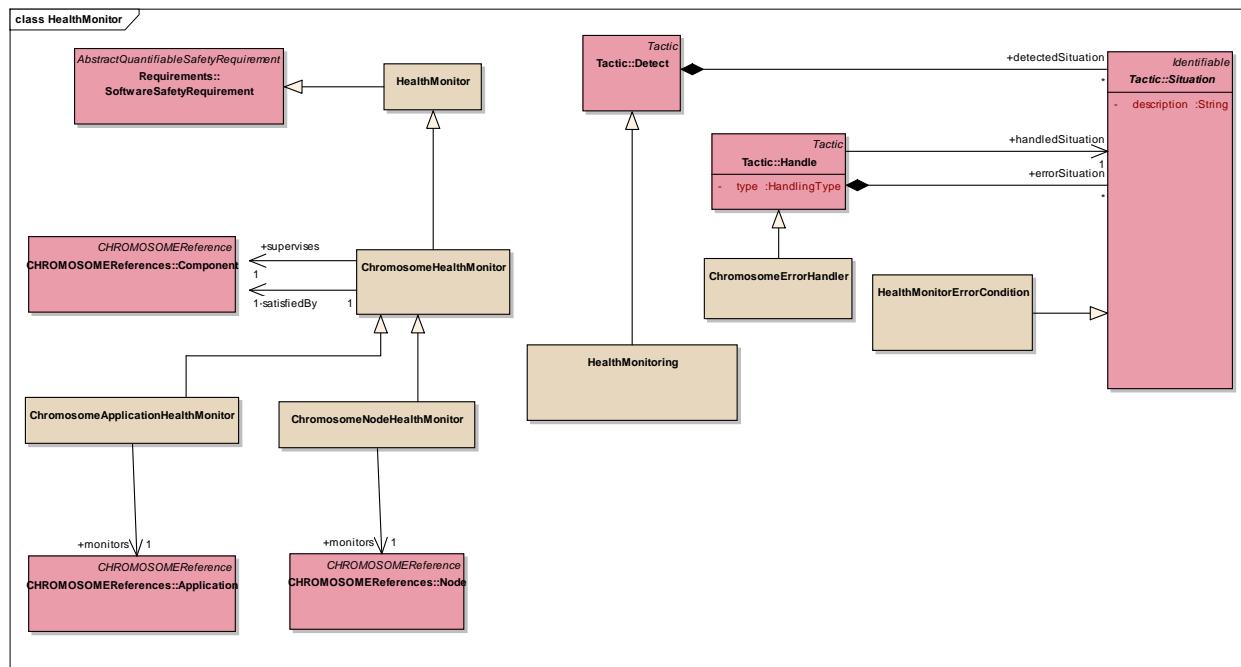

Figure 59: HealthMonitor - (Class diagram)

Diagram Notes:

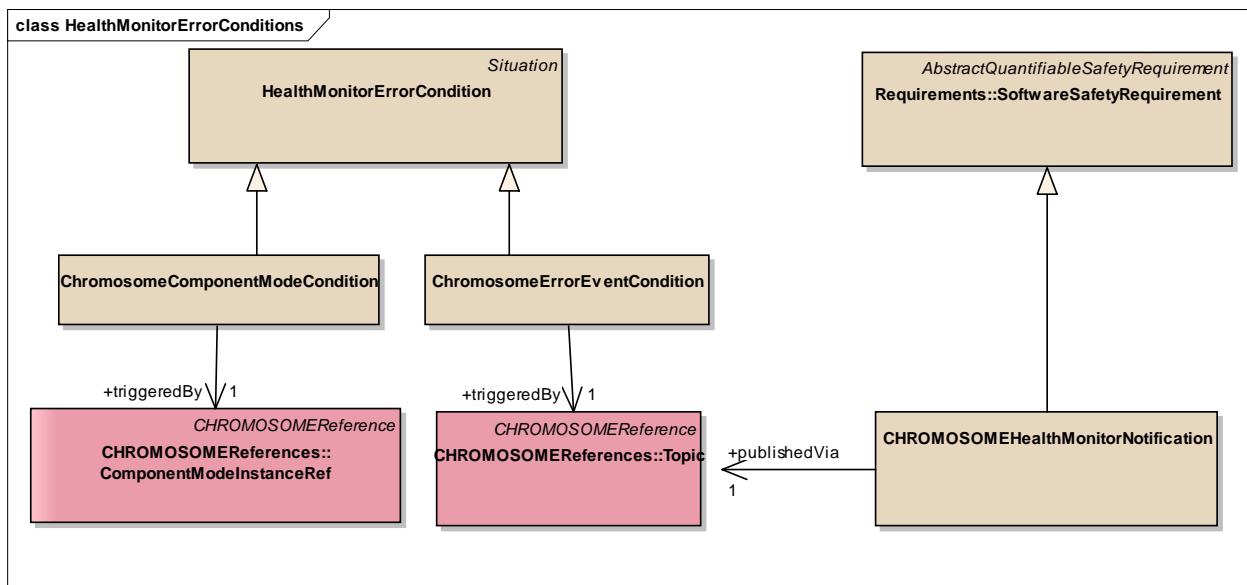

Figure 60: **HealthMonitorErrorConditions** - (Class diagram)

*Diagram Notes:*

### **Class CHROMOSOMEHealthMonitorNotification**

*Element Base Classes:* **SoftwareSafetyRequirement**

*Element Notes:*

Provides a mechanism to delegate error handling to the CHROMOSOME HealthMonitor.

#### Connections

Connector	Source	Target
<u>Generalization</u> Source -> Destination	CHROMOSOMEHealthMonitorNotification	SoftwareSafetyRequirement
<u>Association</u> Source -> Destination	CHROMOSOMEHealthMonitorNotification	Topic

### **Class ChromosomeApplicationHealthMonitor**

**Element Base Classes:** **ChromosomeHealthMonitor*****Element Notes:***

CHROMOSOME specific Health Monitor meta class for monitoring a Chromosome Application as a set of CHROMOSOME components.

**Connections**

Connector	Source	Target
<b><u>Association</u></b> Source -> Destination	ChromosomeApplicationHealthMonitor	Application
<b><u>Generalization</u></b> Source -> Destination	ChromosomeApplicationHealthMonitor	ChromosomeHealthMonitor

**Class ChromosomeComponentModeCondition****Element Base Classes:** **HealthMonitorErrorCondition*****Element Notes:***

A CHROMOSOME specific condition referencing a Mode of a certain CHROMOSOME component instance. The condition is fired when the component is monitored by the Health Monitor and enters mode specified by triggeredBy relation.

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	ChromosomeComponentModeCondition	HealthMonitorErrorCondition
<b><u>Association</u></b> Source -> Destination	ChromosomeComponentModeCondition	ComponentModeInstanceRef

**Class ChromosomeErrorEventCondition**

*Element Base Classes:* **HealthMonitorErrorCondition**

*Element Notes:*

A CHROMOSOME specific error condition, which is triggered by reception of a message via a predefined CHROMOSOME topic referenced by triggeredBy relation.

**Connections**

Connector	Source	Target
<b><u>Association</u></b> Source -> Destination	ChromosomeErrorEventCondition	Topic
<b><u>Generalization</u></b> Source -> Destination	ChromosomeErrorEventCondition	HealthMonitorErrorCondition

**Class ChromosomeErrorHandler**

*Element Base Classes:* **Handle**

*Element Notes:*

CHROMOSOME specific user-defined error handling function.

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	ChromosomeErrorHandler	Handle

**Class ChromosomeHealthMonitor**

*Element Base Classes:* **HealthMonitor**

*Element Notes:*

CHROMOSOME specific Health Monitor meta class.

**Connections**

Connector	Source	Target
<u>Association</u> Source -> Destination	ChromosomeHealthMonitor	Component
<u>Generalization</u> Source -> Destination	ChromosomeApplicationHealthMonitor	ChromosomeHealthMonitor
<u>Association</u> Source -> Destination	ChromosomeHealthMonitor	Component
<u>Generalization</u> Source -> Destination	ChromosomeHealthMonitor	HealthMonitor
<u>Generalization</u> Source -> Destination	ChromosomeNodeHealthMonitor	ChromosomeHealthMonitor

**Class ChromosomeNodeHealthMonitor***Element Base Classes:* ChromosomeHealthMonitor*Element Notes:*

CHROMOSOME specific Health Monitor meta class for monitoring a Chromosome Node as a set of CHROMOSOME components.

**Connections**

Connector	Source	Target
<u>Association</u> Source -> Destination	ChromosomeNodeHealthMonitor	Node
<u>Generalization</u> Source -> Destination	ChromosomeNodeHealthMonitor	ChromosomeHealthMonitor

**Class HealthMonitor***Element Base Classes:* SoftwareSafetyRequirement*Element Notes:*

This meta-class element defines a health monitor SSR.

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	HealthMonitor	SoftwareSafetyRequirement
<b><u>Generalization</u></b> Source -> Destination	ChromosomeHealthMonitor	HealthMonitor

**Class HealthMonitorErrorCondition***Element Base Classes:* **Situation***Element Notes:***Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	HealthMonitorErrorCondition	Situation
<b><u>Generalization</u></b> Source -> Destination	ChromosomeComponentModeCondition	HealthMonitorErrorCondition
<b><u>Generalization</u></b> Source -> Destination	ChromosomeErrorEventCondition	HealthMonitorErrorCondition

**Class HealthMonitoring***Element Base Classes:* **Detect***Element Notes:*

***Connections***

Connector	Source	Target
<b>Generalization</b> Source -> Destination	HealthMonitoring	Detect

***Package Heartbeat******Package Notes:***

This package groups the elements related to the software safety mechanism Heartbeat.

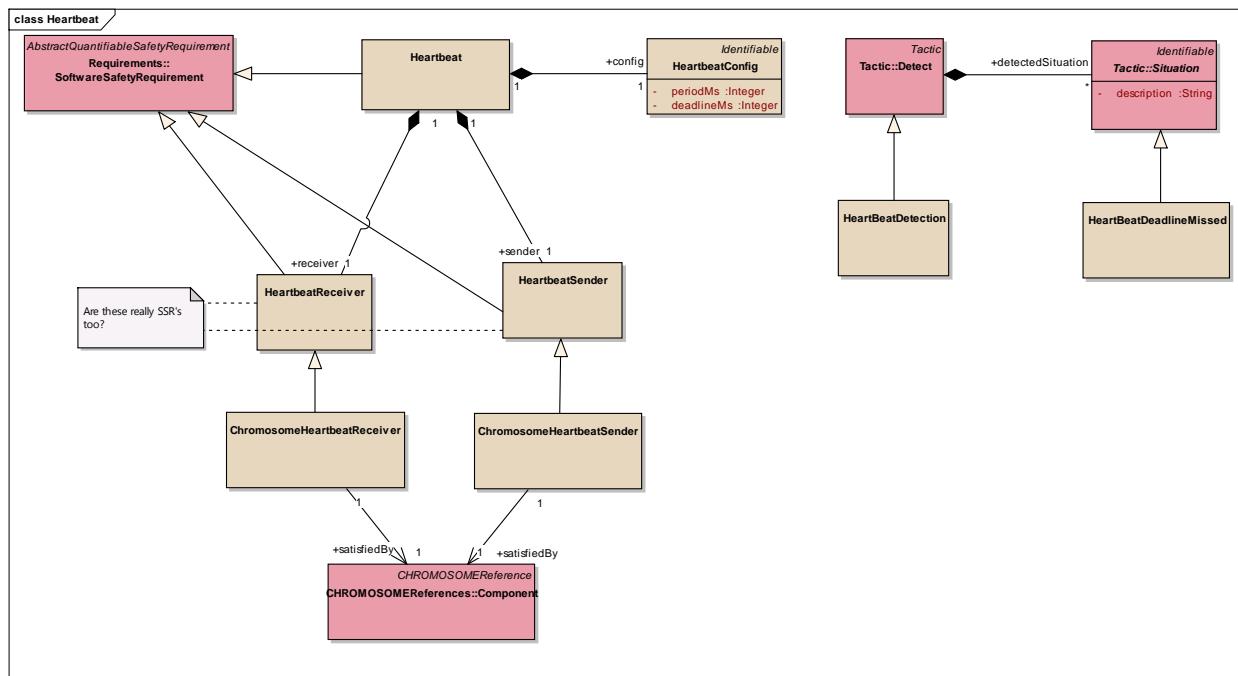

Figure 61: **Heartbeat** - (Class diagram)

***Diagram Notes:*****Class ChromosomeHeartbeatReceiver**

Element Base Classes: **HeartbeatReceiver**

***Element Notes:***

A CHROMOSOME specific meta class to define a heartbeat receiver

**Connections**

Connector	Source	Target
<b><u>Association</u></b> Source -> Destination	ChromosomeHeartbeatReceiver	Component
<b><u>Generalization</u></b> Source -> Destination	ChromosomeHeartbeatReceiver	HeartbeatReceiver

**Class ChromosomeHeartbeatSender***Element Base Classes:* **HeartbeatSender***Element Notes:*

A CHROMOSOME specific meta class to define a heartbeat sender.

**Connections**

Connector	Source	Target
<b><u>Association</u></b> Source -> Destination	ChromosomeHeartbeatSender	Component
<b><u>Generalization</u></b> Source -> Destination	ChromosomeHeartbeatSender	HeartbeatSender

**Class HeartBeatDeadlineMissed***Element Base Classes:* **Situation***Element Notes:***Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	HeartBeatDeadlineMissed	Situation

**Class HeartBeatDetection***Element Base Classes:* **Detect***Element Notes:***Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	HeartBeatDetection	Detect

**Class Heartbeat***Element Base Classes:* **SoftwareSafetyRequirement***Element Notes:*

A Heartbeat SSR requires that two runnable entities on different nodes are instantiated and one of them monitors the signals arriving from the other one.

**Connections**

Connector	Source	Target
<b><u>Aggregation</u></b> Source -> Destination	HeartbeatConfig	Heartbeat
<b><u>Aggregation</u></b> Source -> Destination	HeartbeatSender	Heartbeat
<b><u>Aggregation</u></b> Source -> Destination	HeartbeatReceiver	Heartbeat
<b><u>Generalization</u></b> Source -> Destination	Heartbeat	SoftwareSafetyRequirement

**Class HeartbeatConfig***Element Base Classes:* **Identifiable***Element Notes:*

Configuration of Heartbeat SSR: timing of source and receiver.

**Connections**

Connector	Source	Target
<b><u>Aggregation</u></b> Source -> Destination	HeartbeatConfig	Heartbeat
<b><u>Generalization</u></b> Source -> Destination	HeartbeatConfig	Identifiable

**Attributes**

Attribute	Notes	Default
<b>periodMs</b> Integer		
<b>deadlineMs</b> Integer		

**Class HeartbeatReceiver***Element Base Classes:* **SoftwareSafetyRequirement***Element Notes:*

An SSR representing the receiver of the heartbeat signal.

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	HeartbeatReceiver	SoftwareSafetyRequirement
<b><u>Aggregation</u></b> Source -> Destination	HeartbeatReceiver	Heartbeat
<b><u>NoteLink</u></b>	<anonymous>	HeartbeatReceiver

Connector	Source	Target
Source -> Destination		
<b>Generalization</b>	ChromosomeHeartbeatReceiver	HeartbeatReceiver
Source -> Destination		

### **Class HeartbeatSender**

*Element Base Classes:* **SoftwareSafetyRequirement**

*Element Notes:*

An SSR representing the sender of the heartbeat signal.

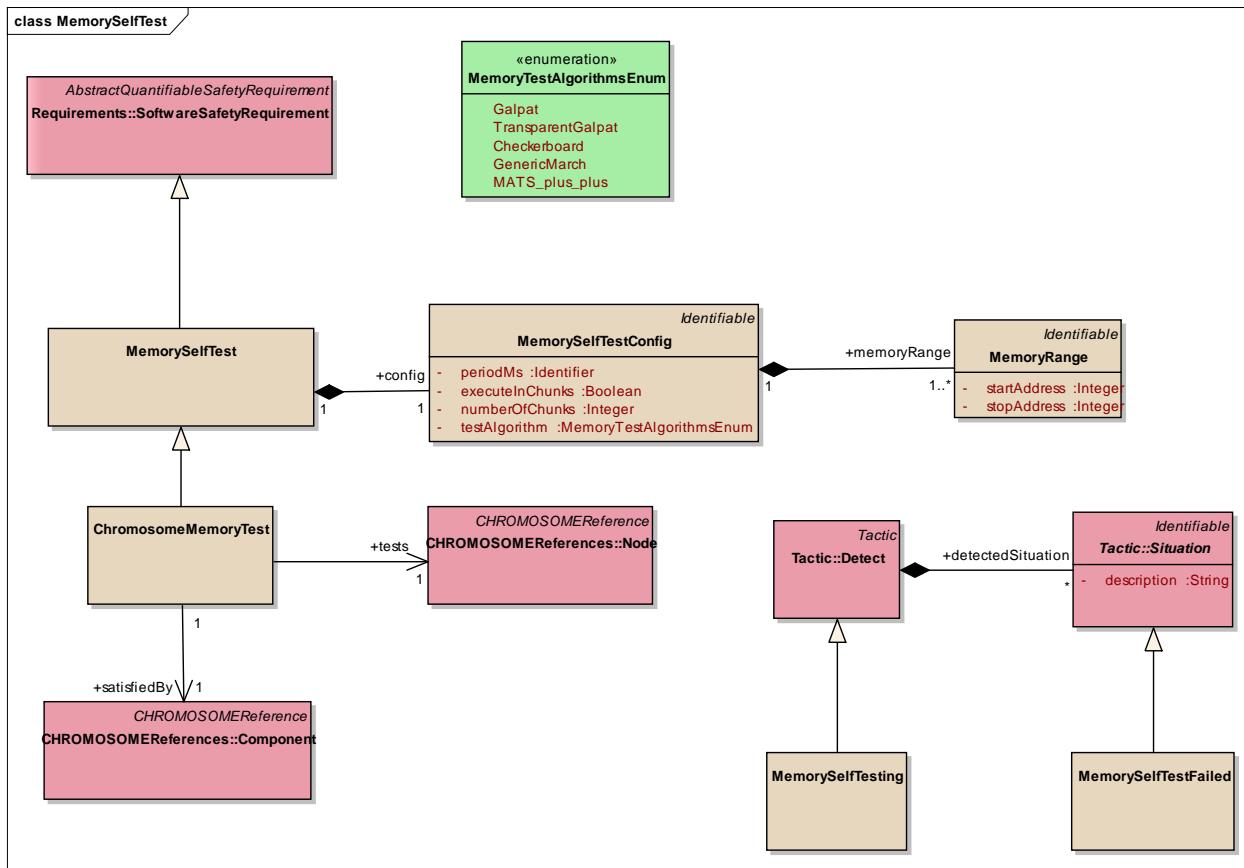

#### **Connections**

Connector	Source	Target
<b>Generalization</b>	HeartbeatSender	SoftwareSafetyRequirement
Source -> Destination		
<b>Aggregation</b>	HeartbeatSender	Heartbeat
Source -> Destination		
<b>NoteLink</b>	<anonymous>	HeartbeatSender
Source -> Destination		
<b>Generalization</b>	ChromosomeHeartbeatSender	HeartbeatSender
Source -> Destination		

### **Package MemorySelfTest**

*Package Notes:*

This package groups the elements related to the software safety mechanism Memory (RAM) Self Test

Figure 62: **MemorySelfTest** - (Class diagram)

*Diagram Notes:*

### Class ChromosomeMemoryTest

*Element Base Classes:* **MemorySelfTest**

*Element Notes:*

A CHROMOSOME-specific MemorySelfTest requirement.

### Connections

Connector	Source	Target
<u>Association</u> Source -> Destination	ChromosomeMemoryTest	Node
<u>Generalization</u> Source -> Destination	ChromosomeMemoryTest	MemorySelfTest

Connector	Source	Target
<u>Association</u> Source -> Destination	ChromosomeMemoryTest	Component

### Class MemoryRange

*Element Base Classes:* Identifiable

*Element Notes:*

An address range is a class to specify the exact range of addresses in the node address space to be tested.

#### Connections

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	MemoryRange	MemorySelfTestConfig

Connector	Source	Target
<u>Generalization</u> Source -> Destination	MemoryRange	Identifiable

#### Attributes

Attribute	Notes	Default
<b>startAddress</b> Integer		
<b>stopAddress</b> Integer		

### Class MemorySelfTest

*Element Base Classes:* SoftwareSafetyRequirement

*Element Notes:*

A meta class defining Memory Self-Test SSR.

#### Connections

Connector	Source	Target
-----------	--------	--------

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	MemorySelfTestConfig	MemorySelfTest
<u>Generalization</u> Source -> Destination	ChromosomeMemoryTest	MemorySelfTest
<u>Generalization</u> Source -> Destination	MemorySelfTest	SoftwareSafetyRequirement

### Class MemorySelfTestConfig

*Element Base Classes:* Identifiable

*Element Notes:*

Specifies configuration parameters for MemorySelfTest SSR.

#### Connections

Connector	Source	Target
<u>Generalization</u> Source -> Destination	MemorySelfTestConfig	Identifiable
<u>Aggregation</u> Source -> Destination	MemorySelfTestConfig	MemorySelfTest
<u>Aggregation</u> Source -> Destination	MemoryRange	MemorySelfTestConfig

#### Attributes

Attribute	Notes	Default
<b>periodMs</b> Identifier		
<b>executeInChunks</b> Boolean		
<b>numberOfChunks</b> Integer		
<b>testAlgorithm</b> MemoryTestAlgorithmsEn		

Attribute	Notes	Default
um		

**Class MemorySelfTestFailed***Element Base Classes:* **Situation***Element Notes:***Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	MemorySelfTestFailed	Situation

**Class MemorySelfTesting***Element Base Classes:* **Detect***Element Notes:***Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	MemorySelfTesting	Detect

**Enumeration MemoryTestAlgorithmsEnum***Element Base Classes:**Element Notes:*

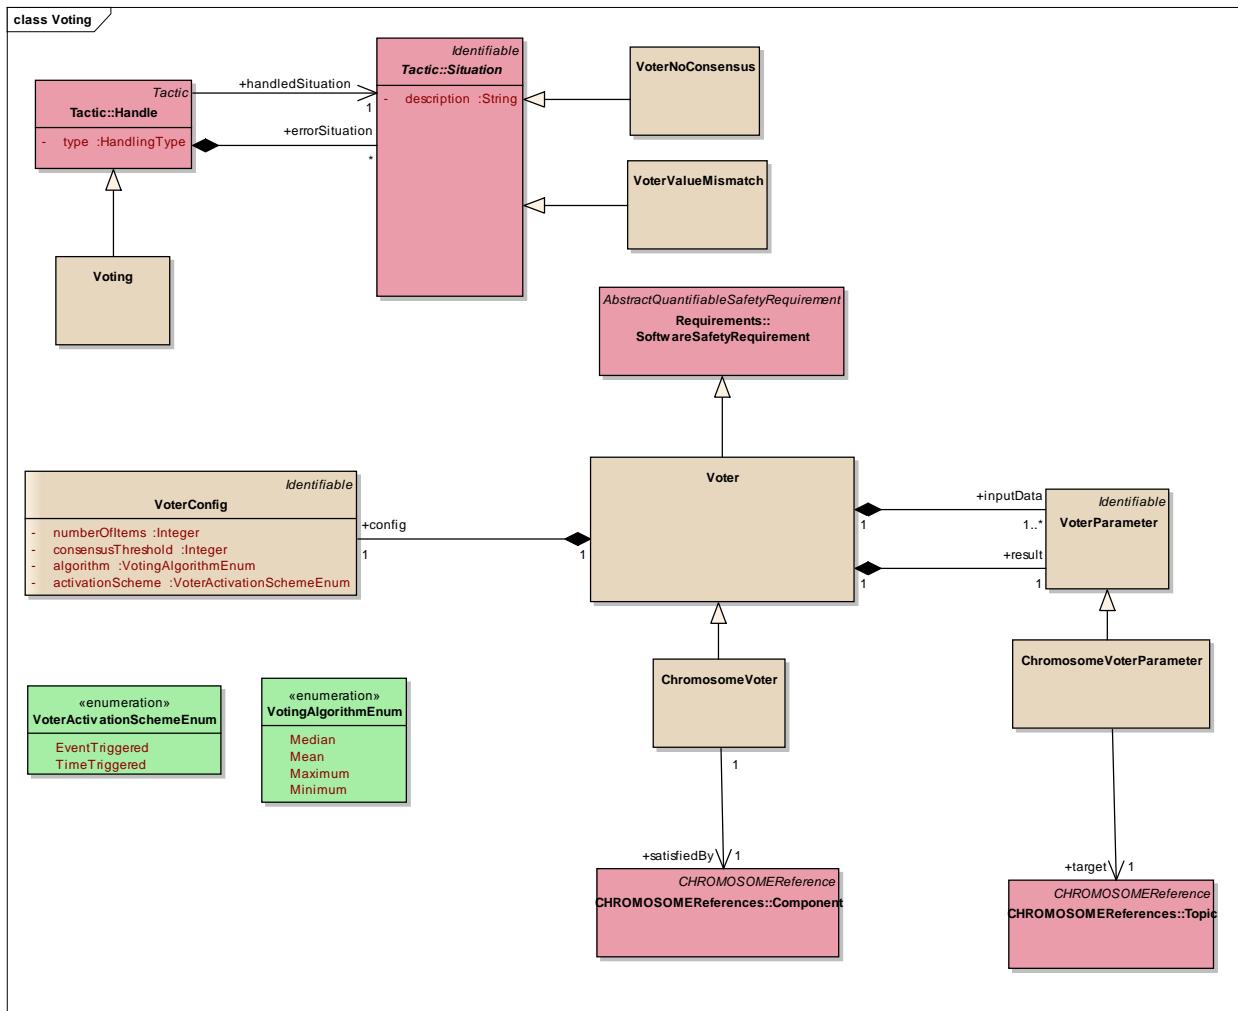

Defines different memory test algorithms that can be defined in a configuration

***Attributes***

Attribute	Notes	Default
<b>Galpat</b>		
<b>TransparentGalpat</b>		
<b>Checkerboard</b>		
<b>GenericMarch</b>		
<b>MATS_plus_plus</b>		

***Package Voting******Package Notes:***

This package groups the elements related to the software safety mechanism Voting

Figure 63: Voting - (Class diagram)

*Diagram Notes:*

### Class ChromosomeVoter

*Element Base Classes:* Voter

*Element Notes:*

A CHROMOSOME-specific meta class for Voting

### Connections

Connector	Source	Target
-----------	--------	--------

Connector	Source	Target
<u>Generalization</u> Source -> Destination	ChromosomeVoter	Voter
<u>Association</u> Source -> Destination	ChromosomeVoter	Component

**Class ChromosomeVoterParameter***Element Base Classes:* [VoterParameter](#)*Element Notes:*

A CHROMOSOME-specific voting parameter meta class.

**Connections**

Connector	Source	Target
<u>Association</u> Source -> Destination	ChromosomeVoterParameter	Topic
<u>Generalization</u> Source -> Destination	ChromosomeVoterParameter	VoterParameter

**Class Voter***Element Base Classes:* [SoftwareSafetyRequirement](#)*Element Notes:*

A meta-class representing the Voting software safety requirement.

**Connections**

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	VoterParameter	Voter
<u>Generalization</u> Source -> Destination	ChromosomeVoter	Voter

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	VoterParameter	Voter
<u>Generalization</u> Source -> Destination	Voter	SoftwareSafetyRequirement
<u>Aggregation</u> Source -> Destination	VoterConfig	Voter

**Enumeration VoterActivationSchemeEnum***Element Base Classes:**Element Notes:*

Possible activation schemes for a Voting component.

**Attributes**

Attribute	Notes	Default
<b>EventTriggered</b>		
<b>TimeTriggered</b>		

**Class VoterConfig***Element Base Classes:* Identifiable*Element Notes:*

Configuration of a Voting SSR

**Connections**

Connector	Source	Target
<u>Generalization</u> Source -> Destination	VoterConfig	Identifiable

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	VoterConfig	Voter

**Attributes**

Attribute	Notes	Default
<b>numberOfItems</b> Integer		
<b>consensusThreshold</b> Integer		
<b>algorithm</b> VotingAlgorithmEnum		
<b>activationScheme</b> VoterActivationSchemeEnum		

**Class VoterNoConsensus***Element Base Classes:* Situation*Element Notes:***Connections**

Connector	Source	Target
<u>Generalization</u> Source -> Destination	VoterNoConsensus	Situation

**Class VoterParameter***Element Base Classes:* Identifiable*Element Notes:*

A meta-class for representing input data and outputs of a Voting SSR.

**Connections**

Connector	Source	Target
<b><u>Aggregation</u></b> Source -> Destination	VoterParameter	Voter
<b><u>Generalization</u></b> Source -> Destination	ChromosomeVoterParameter	VoterParameter
<b><u>Aggregation</u></b> Source -> Destination	VoterParameter	Voter
<b><u>Generalization</u></b> Source -> Destination	VoterParameter	Identifiable

**Class VoterValueMismatch***Element Base Classes:* **Situation***Element Notes:***Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	VoterValueMismatch	Situation

**Class Voting***Element Base Classes:* **Handle***Element Notes:***Connections**

Connector	Source	Target

Connector	Source	Target
<u>Generalization</u>	Voting	Handle
Source -> Destination		

## Enumeration VotingAlgorithmEnum

*Element Base Classes:*

*Element Notes:*

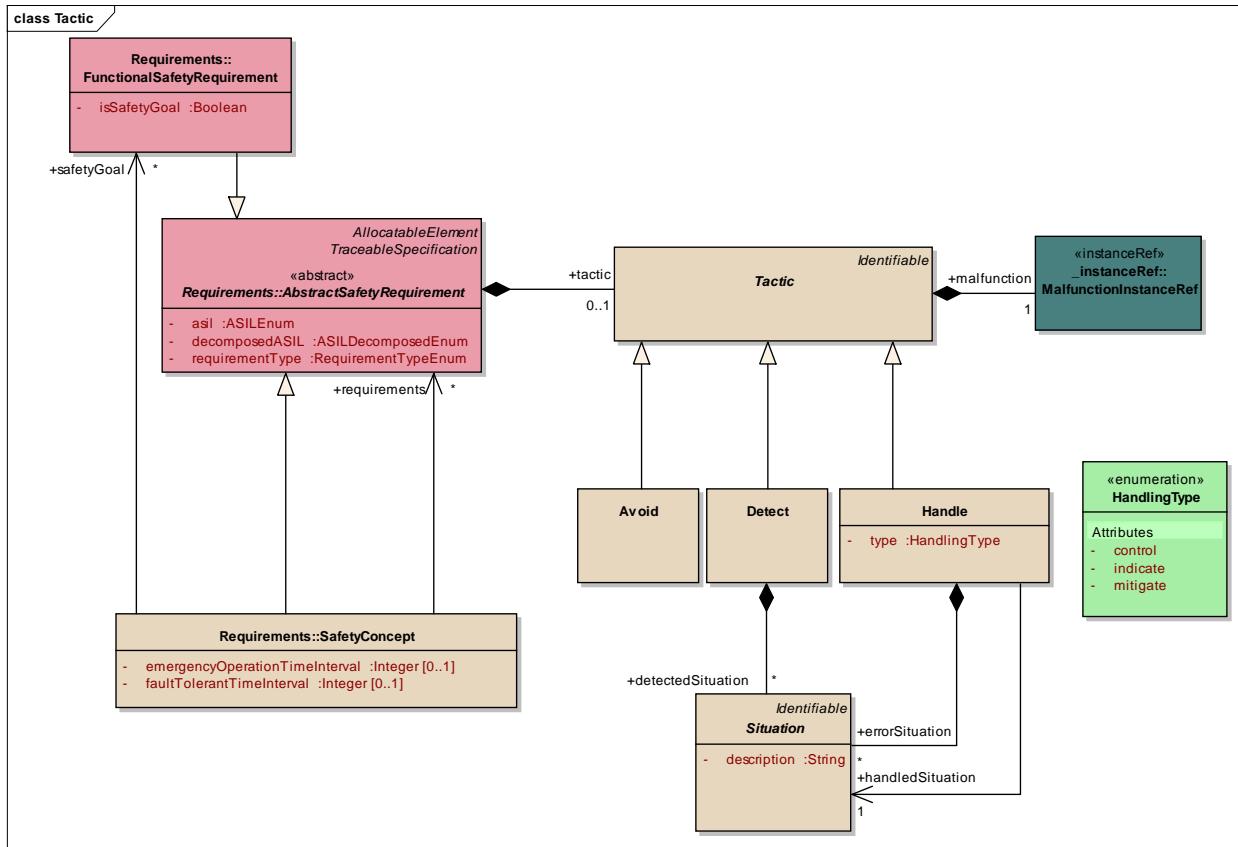

Possible voting algorithms: if the values are different, which one should be returned?

### Attributes

Attribute	Notes	Default
<b>Median</b>		
<b>Mean</b>		
<b>Maximum</b>		
<b>Minimum</b>		

## **Package Tactic**

*Package Notes:*

Figure 64: **Tactic** - (Class diagram)

*Diagram Notes:*

### Class Avoid

*Element Base Classes:* **Tactic**

*Element Notes:*

Classifies requirements as avoidance requirements.

### Connections

Connector	Source	Target
<b>Generalization</b> Source -> Destination	Avoid	Tactic

## **Class Detect**

Element Base Classes: **Tactic**

*Element Notes:*

Classifies requirements as detection requirements

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	HealthMonitoring	Detect
<b><u>Generalization</u></b> Source -> Destination	ControlFlowErrorDetection	Detect
<b><u>Generalization</u></b> Source -> Destination	GradientCheckDetection	Detect
<b><u>Generalization</u></b> Source -> Destination	MemorySelfTesting	Detect
<b><u>Generalization</u></b> Source -> Destination	HeartBeatDetection	Detect
<b><u>Generalization</u></b> Source -> Destination	ComparisonDetection	Detect
<b><u>Generalization</u></b> Source -> Destination	ActuatorErrorDetection	Detect
<b><u>Generalization</u></b> Source -> Destination	Detect	Tactic
<b><u>Generalization</u></b> Source -> Destination	ContextRangeCheckDetection	Detect
<b><u>Generalization</u></b> Source -> Destination	CpuSelfTestDetection	Detect
<b><u>Generalization</u></b> Source -> Destination	CRCErrorDetection	Detect
<b><u>Generalization</u></b> Source -> Destination	SoftwareAlivenessDetection	Detect
<b><u>Aggregation</u></b> Source -> Destination	Situation	Detect

## **Class Handle**

*Element Base Classes:* **Tactic**

*Element Notes:*

Classifies requirements as handling requirements.

### **Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	FilterBasedHandling	Handle
<b><u>Generalization</u></b> Source -> Destination	Handle	Tactic
<b><u>Generalization</u></b> Source -> Destination	ChromosomeErrorHandler	Handle
<b><u>Association</u></b> Source -> Destination	Handle	Situation
<b><u>Generalization</u></b> Source -> Destination	WarningAndDegradationHandle	Handle
<b><u>Generalization</u></b> Source -> Destination	Voting	Handle
<b><u>Aggregation</u></b> Source -> Destination	Situation	Handle

### **Attributes**

Attribute	Notes	Default
<b>type</b> HandlingType		

## **Enumeration HandlingType**

*Element Base Classes:*

*Element Notes:*

**Attributes**

Attribute	Notes	Default
<b>control</b>		
<b>indicate</b>		
<b>mitigate</b>		

**Class Situation**

Element Base Classes: **Identifiable**

*Element Notes:*

Defines the possible error detection situations a given requirement might be able to detect. For example, at the functional safety level, a detection requirement might detect "vehicle yaw rate too high", this is an error situation related to the detection of vehicle yaw rate malfunctions.

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	HealthMonitorErrorCondition	Situation
<b><u>Generalization</u></b> Source -> Destination	AlivenessCheckpointTooEarly	Situation
<b><u>Generalization</u></b> Source -> Destination	MemorySelfTestFailed	Situation
<b><u>Generalization</u></b> Source -> Destination	ValueAboveRange	Situation
<b><u>Generalization</u></b> Source -> Destination	FilterError	Situation
<b><u>Generalization</u></b>	AlivenessCheckpointTooOften	Situation

<b>Connector</b>	<b>Source</b>	<b>Target</b>

## Package SafetyAnalysis

*Package Notes:*

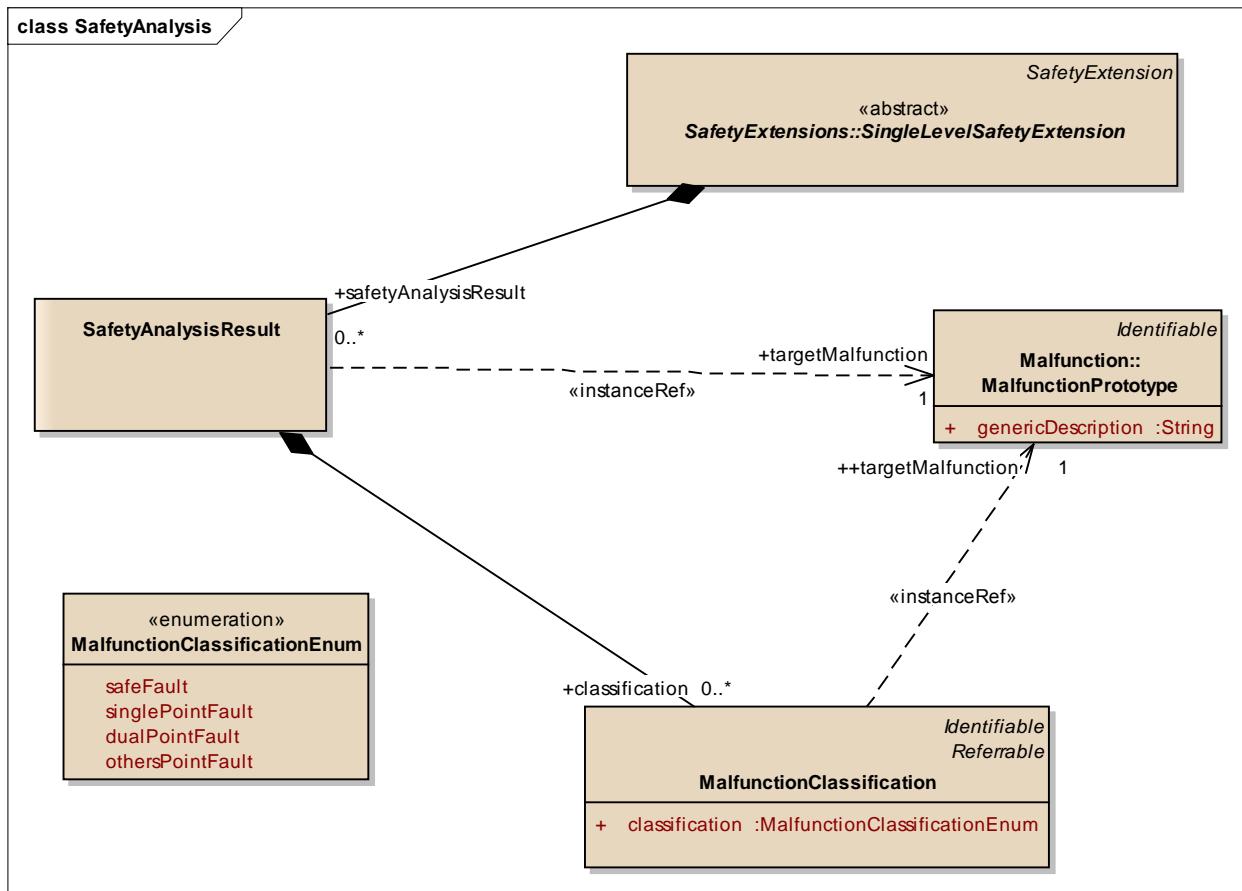

Figure 65: SafetyAnalysis - (Class diagram)

*Diagram Notes:*

### Class SafetyAnalysisResult

*Element Base Classes:*

*Element Notes:*

This class represent the container for all Hardware Failure Analysis.

Each safety goal (as malfunction) must lead to a safety analysis, so this class contains all the information related to the analysis as :

- the relation to the malfunction as the malfunctionPrototype for each analysis

- the HwComponentPrototypeScope to identify all hardware component specific to the context as HWComponentPrototype inside a type composition
- the HWQuantifiedFailure Analysis performed on the level of the composition

### Connections

Connector	Source	Target
<u>Aggregation</u> Source -> Destination	MalfunctionClassification	SafetyAnalysisResult
<u>Aggregation</u> Source -> Destination	SafetyAnalysisResult	SingleLevelSafetyExtension
<u>Generalization</u> Source -> Destination	HWSafetyAnalysisResult	SafetyAnalysisResult
<u>Aggregation</u> Source -> Destination	MalfunctionInstanceRef	SafetyAnalysisResult
<u>Dependency</u> Source -> Destination	SafetyAnalysisResult	MalfunctionPrototype

### Class MalfunctionClassification

*Element Base Classes:* Identifiable, Referrable

*Element Notes:*

This class HWFault represent the characterization of a HWComponent Fault defined by tags as Safe Fault, SinglePointFault or MultiplePointFault of a specific FailureMode in a context of an Hardware Architecture.

HardwareFault can only exist for HardwareComponentPrototype when HWComponent are used given by the HWComponentPrototypeScope.

The related malfunction (link to violation of a SafetyGoals) is already linked with the FailureMode of the HardwareComponent via the HWSafetyGoalRelated meta class.

The different values are:

SafeFault: no violation of safety goal

ResidualOrSinglePointFault: direct violation of the SafetyGoal (1st order fault)

**MultiplePointFault** : violation of the SafetyGoal in combination with an independent failure of another component (minimum 2nd order)

Multiple-point fault for  $n > 2$  are considered as safe faults unless shown to be relevant in the technical safety concept (see ISO Part 5 7.4.3.2 Note 1).

#### Connections

<b><u>Generalization</u></b> Source -> Destination	MalfunctionClassification	Identifiable

#### Attributes

Attribute	Notes	Default
<b>classification</b> MalfunctionClassificationE num		

#### Enumeration MalfunctionClassificationEnum

*Element Base Classes:*

*Element Notes:*

This enumeration includes the possible characterizations for the attribute hwFaultType in Class HWFault.

For simplification and clarification only SafeFault, SinglePointFault and DualPointFault and othersPointFault are derived from the ISO Part 5 7.4.3.2.

SinglePointFault represents a first order fault, while DualPointFault represents a second order fault, and OthersPointFault order greater than two. For the hardware fault description, an cut set order of two is adequate. Therefore, an limited order of two (see ISO Part 5 7.4.3.2) can be defined. This means, that multiplePointFault represents an second order fault (dualPointFault).

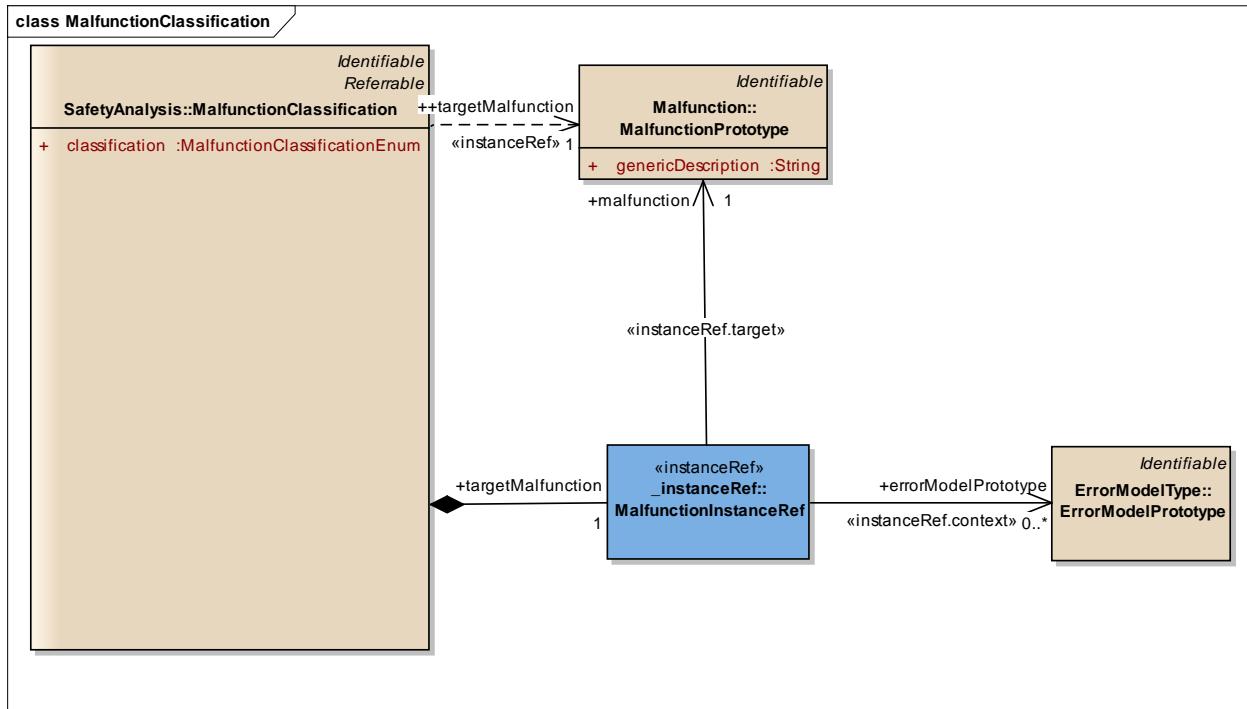

The precise characterization of a HWFault (e.g. Multiple-Point-Latent) can be derived from the value of the attribute hwFaultType and a possible existence of a SafetyMechanism.

#### Attributes

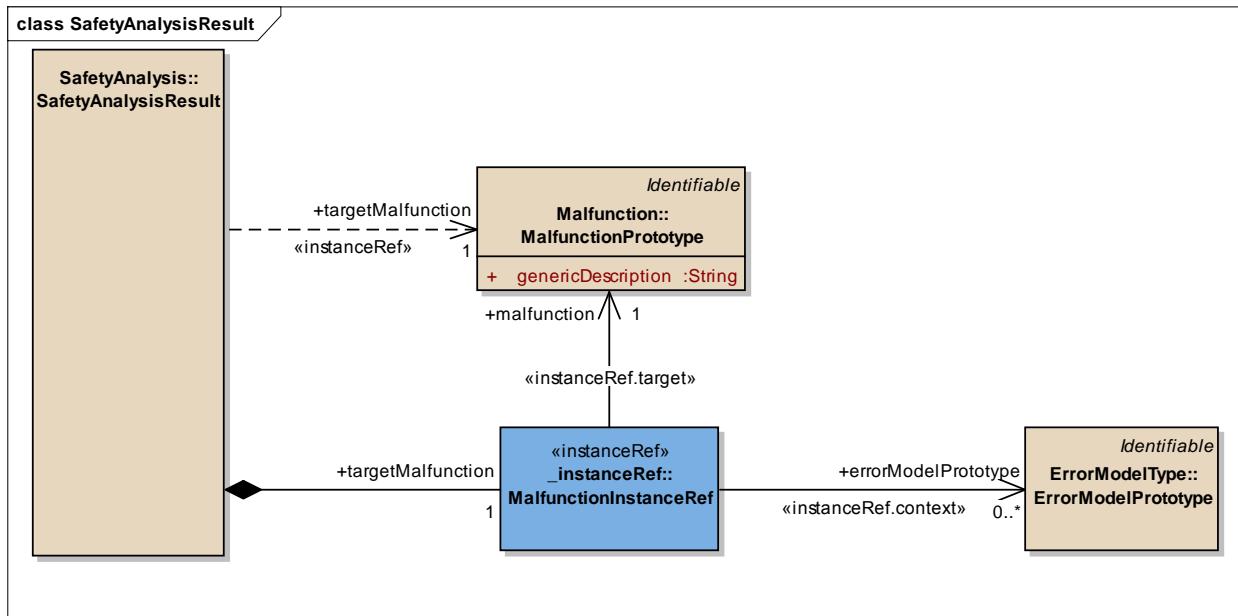

Attribute	Notes	Default
<b>safeFault</b>	This literal describes the characterization as a safe fault.	
<b>singlePointFault</b>	This literal describes the characterization as a single-point of failure (direct violation).	
<b>dualPointFault</b>	This literal describes the characterization as a multiple-point fault (violation in combination with another independent fault).	
<b>othersPointFault</b>

### Class BooleanConfigParameterValue

*Element Base Classes:* **ConfigParameterValue**

*Element Notes:*

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	BooleanConfigParameterValue	ConfigParameterValue

**Class CodeGenerationConfiguration**

*Element Base Classes:* **Identifiable**

*Element Notes:*

An SSMConfiguration defines the parameters needed by specific code generators. It provides a set of name/value pairs which contain additional information not defined within the software safety mechanism.

**Connections**

Connector	Source	Target
<b><u>Aggregation</u></b> Source -> Destination	CodeGenerationConfiguration	ImplementationSafetyExtension
<b><u>Aggregation</u></b> Source -> Destination	ConfigParameter	CodeGenerationConfiguration
<b><u>Association</u></b> Source -> Destination	CodeGenerationConfiguration	SoftwareSafetyRequirement
<b><u>Generalization</u></b> Source -> Destination	CodeGenerationConfiguration	Identifiable
<b><u>Aggregation</u></b> Source -> Destination	CodeGenerationConfiguration	TechnicalSafetyRequirement

**Class ConfigParameter**

*Element Base Classes:* **Identifiable***Element Notes:*

A ConfigParameter contains the name of the parameter and the value for this parameter.

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	ConfigParameter	Identifiable
<b><u>Aggregation</u></b> Source -> Destination	ConfigParameter	CodeGenerationConfiguration
<b><u>Aggregation</u></b> Source -> Destination	ConfigParameterValue	ConfigParameter

**Class ConfigParameterValue***Element Base Classes:**Element Notes:*

A ConfigParameterValue is the abstract element allowing extensions to be made for code generator parameters. In this fashion new parameter value types can be added later on as needed.

**Connections**

Connector	Source	Target
<b><u>Generalization</u></b> Source -> Destination	IdentifierConfigParameterValue	ConfigParameterValue
<b><u>Generalization</u></b> Source -> Destination	ConstantComparisonParameter	ConfigParameterValue

<b>Generalization</b>	StringConfigParameterValue	ConfigParameterValue
Source -> Destination		

### ***Class FloatConfigParameterValue***

*Element Base Classes:* **ConfigParameterValue**

*Element Notes:*

The FloatConfigParameterValue defines the float parameter value type.

**Connections**

Connector	Source	Target
<b>Generalization</b>	FloatConfigParameterValue	ConfigParameterValue
Source -> Destination		

### ***Class IdentifierConfigParameterValue***

*Element Base Classes:* **ConfigParameterValue**

*Element Notes:*

**Connections**

Connector	Source	Target
<b>Generalization</b>	IdentifierConfigParameterValue	ConfigParameterValue
Source -> Destination		

**Class IntegerConfigParameterValue***Element Base Classes:* **ConfigParameterValue***Element Notes:*

This element defines a specific parameter value type, in this case an integer value.

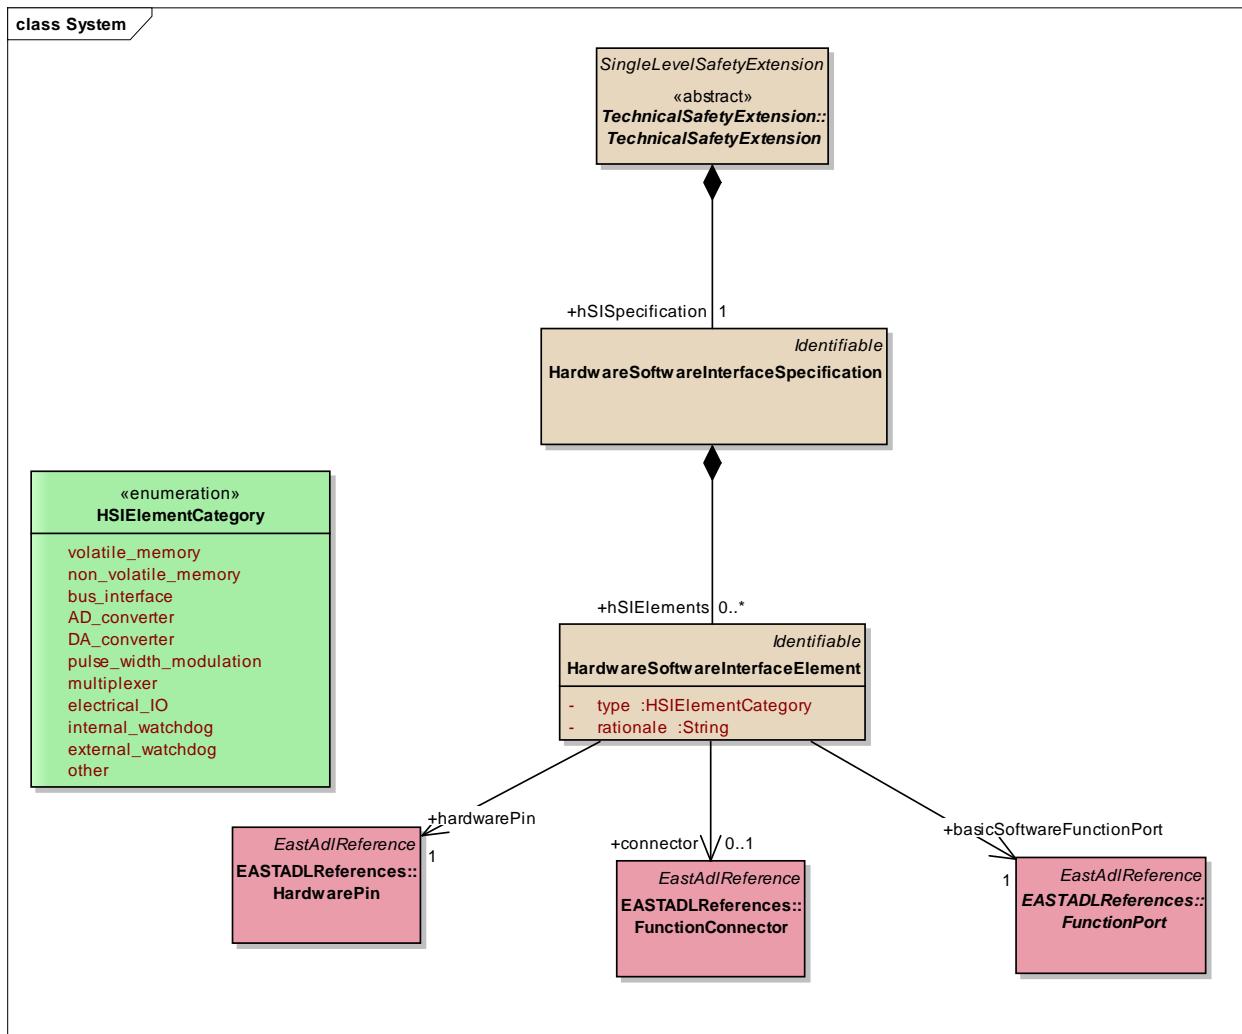

**Connections**

Connector	Source	Target
<b>Generalization</b> Source -> Destination	IntegerConfigParameterValue	ConfigParameterValue

**Class StringConfigParameterValue***Element Base Classes:* **ConfigParameterValue***Element Notes:***Connections**

## Class HardwareSoftwareInterfaceElement

*Element Base Classes:* Identifiable

*Element Notes:*

An element within the HSI specification.

Constraint: (see EAST-ADL) the associated FunctionConnector has to be a specific connector that connects a BasicSoftwareFunctionType with a HardwareFunctionType.

Note: The FunctionConnector is an optional information of the HSI Element as it can also be derived from the associated HardwarePin and FunctionPort.

Constraint: (see EAST-ADL) the HardwarePin is contained in a HardwareComponentType that is associated with the HardwareFunctionType which port is connected by the forementioned connector.

Constraint: (see EAST-ADL) the FunctionPort has to be associated with a BasicSoftwareFunctionType

#### Connections

<b>rationale</b> String		

## Class HardwareSoftwareInterfaceSpecification

*Element Base Classes:* Identifiable

#### *Element Notes:*

The HardwareSoftwareInterface (HSI) specification specifies the hardware and software interaction.

The HSI specification includes the component's hardware devices that are controlled by software and hardware resources that support the execution of software.

The HSI specification shall includes the following characteristics:

a) the relevant operating modes of hardware devices and the relevant configuration parameters;

EXAMPLE 1 Operating modes of hardware devices such as: default, init, test or advanced modes.

EXAMPLE 2 Configuration parameters such as: gain control, band pass frequency or clock prescaler.

b) the hardware features that ensure the independence between elements and that support software partitioning;

c) shared and exclusive use of hardware resources;

EXAMPLE 3 Memory mapping, allocation of registers, timers, interrupts, I/O ports.

d) the access mechanism to hardware devices; and

EXAMPLE 4 Serial, parallel, slave, master/slave.

e) the timing constraints defined for each service involved in the technical safety concept.
